May 23, 1985

Honorable Members of the General Assembly State House Springfield, Illinois 62706

Dear Members of the General Assembly:

Population projections are based on estimates of length of stay and admissions to prison for future years. Last year, projections were made based on the assumption new admissions would continue to increase by 8.6% a year, which equaled the average increase of the last three years less misdemeanants.

Monitoring of the population projection found a growing variance between projected population and actual population. The major factors accounting for the reduction in population were a 4% decrease in fiscal year 1984 admissions and an overestimate of the impact of the suspension of the Meritorious Good Time (MGT) policy. These trends were observed and discussed publicly in the spring of 1984. We were not convinced that the long term outlook had been altered significantly until the trend had continued for several months. Consequently, we reviewed every aspect of our population projections and completed a revision in time for the budget preview in October 1984.

The revised projections have the population at the end of fiscal year 1985 at 17,672 and 1986 at 18,704. This is a reduction of 1,368 for 1985 and 2,300 for 1986. The new projections are tracking well. The variance for the monthly average is .05%. The year-to-date variance on projected admissions is 132 under actual. While the variance on projected exits is

The new projections are the output from a population simulation projection model the department obtained with a technical assistance grant from the National Institute of Corrections (NIC). Working jointly with James Austin, Ph.D, and William Pannell, Ph.D, consultants with the National Council on Crime and Delinquency (NCCD), a simulation model was developed. This model uses a Monte Carlo probability simulation technique to trace inmate cases through the correctional process by assigning probabilities to determine admissions, length of stay, and ultimately, the inmate population. These probabilities are based on our most recent history (fiscal year 1984 data) and our understanding of current policies.

Honorable Members of the General Assembly May 23, 1985
Page 2

This model, and the assumptions we have used, have been reviewed jointly with staff from the Bureau of Budget. Different approaches have been tried, with review and discussion centering on the impact of different assumptions on future populations. I am confident that our model is as sophisticated as any in the nation. This fact, plus the extent to which we have reviewed, critiqued, and revised our assumptions, leaves us very confident in their accuracy.

Contained in this report, for review, are comparisons of the projections, monitoring of the revised projections and the current ten-year projections. Also included is a review of the simulation model, a discussion of the major assumptions, and a listing of all the data parameters included in the model.

Finally, a review of recent criminal justice trends obtained from the Department of Law Enforcement and Administrative Office of the Illinois Courts is provided. These data are intended to place the prison population projections in context.

It is hoped that this report will provide the necessary information by which to assess the status and accuracy of the current Department of Corrections population projections.

Sincerely,

chael P. L. Director

## **PROJECTIONS**

#### ADULT POPULATION PROJECTION MONITORING

#### Population Projection Monitoring Comments

Effective: March 31, 1985

The year-to-date average variance of the population projection is .05%. This represents a difference of 8 between the projected monthly average population (16,895) and actual monthly average population (16,887). The month of March was the first time that the projection was under actual since September 1984.

#### Admissions:

- 1. Year-to-date projected admissions are 132 under the actual resulting in a 1.79% variance.
- 2. March was the first month in fiscal year 1985 in which admissions exceeded 1,000. The projected admissions for March were 910 compared to an actual number of 1,024, resulting in a difference of 114.
- 3. Projected defaulter admissions, returns from community supervision either with a new sentence or as a technical violator, are 286 under actual admissions.
- 4. In fiscal year 1984, 47% of the defaulters were technical violators. This compares to 53% in fiscal year 1985.

#### Exits:

- 1. Year-to-date projected exits are 21 over actual for a .33% variance.
- 2. March projected exits were under actual by 91, for a variance of 13.52%.
- 3. Exits are affected by good time awards and revocations. In fiscal year 1984, 8% of the exits had some time revoked, compared to 18% in 1985, a 10% increase.
- 4. In fiscal year 1985, a slightly lower percentage of those exits with some time revoked had all of their time restored; 31% in 1984 compared to 29% in 1985.

If the trends of increasing admissions and revocation of time continue, the projections will continue to be under the actual populations.

## ADULT POPULATION PROJECTION MONITORING

#### Good Time Probabilities

|   | Simulation<br>Model | Current<br>Population |
|---|---------------------|-----------------------|
| MERITORIOUS GOOD TIME:                          |                     |                       |
| Meritorious Good Time - Median                  | 75 days             | 70 days               |
| TIME REVOKED:                                   |                     |                       |
| Percent of Population with some<br>Time Revoked | 8%                  | 18%                   |
|   |                     |                       |
| TIME RESTORED:                                  |                     |                       |
| Percent of Population with some Time Restored   | 51%                 | 49%                   |
| Percent of Population with all Time Restored    | 31%                 | 29%                   |
|   |                     |                       |

NOTE: Current Population as of March 31, 1985

#### TEN-YEAR POPULATION PROJECTION

(End of Year)

| FISCAL YEAR |  |  | PROJECTED POPULATION |
|-------------|--|--|----------------------|
| 1985        |  |  | 17,672               |
| 1986        |  |  | 18,704               |
| 1987        |  |  | 19,105               |
| 1988        |  |  | 19,570               |
| 1989        |  |  | 20,040               |
| 1990        |  |  | 20,277               |
| 1991        |  |  | 20,828               |
| 1992        |  |  | 21,308               |
| 1993        |  |  | 21,607               |
| 1994        |  |  | 21,583               |
|             |  |  |                      |

These projections use fiscal year 1984 as the base for projecting admissions, length of stay, good time policies, supervision, revocation and other parameters. Court admissions for the entire ten-year period are kept at the fiscal year 1984 base.

Projected prison populations were distributed among institutions for fiscal year 1986. This distribution was based on rated capacity and operational concerns. The institutional budget requests are based on estimated average daily population and not on rated capacity.

## THE SIMULATION MODEL

- Description
- General Flow Chart
- Assumptions
- Data Parameters

## DESCRIPTION Illinois Department of Corrections Prison Population Projection Model

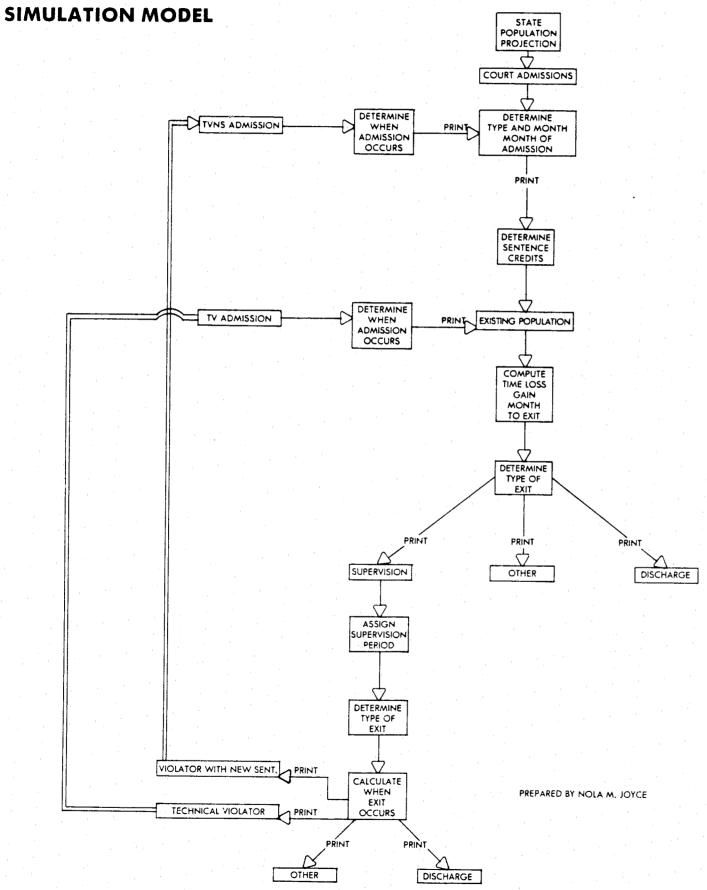

The Illinois Department of Corrections prison population projection model is an example of what are sometimes called stochastic entity simulation models. It is stochastic or probabilistic in the sense that random numbers are used in the process, and an entity simulation in the sense that the model is conceptually designed around the movement of individuals through the prison system. The model is also, more generally, an example of the Monte Carlo simulation technique, again because random numbers are used in the process of simulating the system.

In order to understand the process, it is useful to discuss the output of the model briefly. Two types of projections are produced by a simulation. Population projections, such as prison population and mandatory supervised release, are of primary importance. However, the model also projects movements between, into and out of these two populations. The computer program produces these outputs in the form of vectors of numbers of length 120, representing a ten-year time span by month. These vectors or lists of numbers will be referred to as "trace vectors" in the description of the process below.

The prison and supervised release populations at any point in future time are comprised of two components, that due to the last known existing population and that due to persons entering prison in the following or future time. The model, therefore, treats these components separately.

First, the existing prison and mandatory supervised release populations are decremented. This is done for several populations and in a process that involves several steps. For example, the existing prison felony population members are each assigned to an offense group using Monte Carlo techniques. A time remaining to be served is then determined for each member. Next, good time credit is determined, and finally, credit restored is determined. Through this process, a time in prison is calculated for each existing felon. The presence of each felon is then marked on the prison trace vector. Additionally, when a person exits prison to mandatory supervised release, for example, a mark is made on the prison-supervised release movement trace vector. The offenders may cycle back through prison again eventually exiting the system or exceeding the maximum length of projection. At each stage of progress and at each movement, appropriate trace vectors are updated. The same process as described above is used for the existing mandatory supervised release population and for the new intake populations. The result is a set of fully updated trace vectors which comprise the population and movement projections.

## ILLINOIS DEPARTMENT OF CORRECTIONS

Illinois Department of Corrections
Adult Population Projections
Special Report to the Members of the General Assembly
May 1985

#### Assumptions

#### Adult Population Projections

The adult population is projected by a simulation model. The model is a representation of the incarceration and supervision process. All data parameters are based upon fiscal year 1984 experiences.

Assumptions for the population simulation model are based on the most recent history and/or an understanding of current policies. For most parameters, it is assumed that fiscal year 1984 experiences are indicative of future practices. Detailed below are the key assumptions, plus how and why they have changed from previous simulation runs based on calendar year 1983. This model is as of June 30, 1984, and projects to June 30, 1994.

#### Admission Parameters

#### Court Admissions:

Admissions are projected separately. A demographic-based admission projection was calculated. By taking the number of felony admissions in 1983 by a specific sex, race, and age grouping, and dividing by the state population for that group, an incarceration rate is computed.

Multiplying the incarceration rate by the projected 1984 census estimate of that group determines the projected admission for that group in 1984. This is done separately for each group and then totaled to arrive at projected felony admissions.

Based upon the first six months actual admissions were 205 less than the demographic projected admissions. If this trend continues then, actual admissions will level off at, or drop below, actual admissions of 1983. This is not reflected by demographic projections.

Clearly, this experience brings into question the sole reliability on demographics for projected admissions. It must be remembered that a demographic-based projection assumes arrest, prosecution, and sentencing policies and practices will remain constant. This assumption is not always true. In Illinois, it is difficult to use arrest, conviction, and disposition data because of the different reporting definitions and procedures used by the police, prosecutors, and the courts.

In fiscal year 1984, there was a 4% drop in court admissions (violators with a new sentence not included). Because of this trend and a decreasing crime rate, the model assumes a flat admission rate at the fiscal year 1984 number of 7,005. It should be noted that projected admissions, based upon demographics, indicate continued growth in admissions.

Differences in Demographic Projections of Court Admissions and Assumptions in the Model

| Year | Demographic<br>Projection | Model<br>Assumption |
|------|---------------------------|---------------------|
| 1985 | 7,525                     | 7,005               |
| 1986 | 7,610                     | 7,005               |
| 1987 | 7,667                     | 7,005               |
| 1988 | 7,725                     | 7,005               |
| 1989 | 7,784                     | 7,005               |
| 1990 | 7,845                     | 7,005               |
| 1991 | 7,896                     | 7,005               |
| 1992 | 7,939                     | 7,005               |
|      | ,                         |                     |

One of the key assumptions in the simulation model is projected court admissions. The model assumes a fiscal year 1984 admission number throughout the ten year period.

Defaulter Admissions: (New Sentence & Technical Violators)

Technical and new sentence violator admissions are based upon feedback logic in the program. The number of admissions is determined by a violation rate and the type of violation. The violation rate is determined by the total number of violations in fiscal year 1984 divided by the average daily caseload. This computation produces a .33 violation rate; 47% of all violators are technical. It is these probabilities that will determine violator admissions.

It is possible that these admissions will be under the actual because of the hiring of 20 apprehension officers and 25 additional parole agents. At this point, it is difficult to determine the impact of this new staffing level.

Sentence Distributions for Admissions:

There was a 1.3% increase in Class 4 admissions. For all classes of crime, the sentence length has increased from fiscal year 1983 to fiscal year 1984. Most notably, the shift is toward the maximum sentences. Also sentences for violators with new sentences for all classes of crime are longer than sentences for straight court admissions. 42% of Class X violators with new sentences had a sentence over 120 months; compared to 30.2% of court admissions. Violators with new sentences increased from 15% of admissions in fiscal year 1982 to 19% in 1984, suggesting that more inmates are being sentenced for longer terms than in the past. These trends will have the greatest impact beyond fiscal year 1987.

Length of stay for new admissions is determined by sentence, jail credit, probation credit, day-for-day good time, and other good time practices. All of these data parameters are based on fiscal year 1984 admission experiences.

Illinois Department of Corrections
Adult Population Projections
Special Report to the Members of the General Assembly
May 1985

Technical Violators Length of Stay:

Based upon actual length of stay for violators in 1984, 88% stayed 3 months or less in the prison system. However, 3% stayed longer than 6 months. The model will use this actual distribution to determine exits for technical violators.

Meritorious Good Time (MGT) Assumption:

The mean number of MGT days awarded to fiscal year 1984 exits was 45, and the median was zero. This analysis reflects both MGT awards before and after the Illinois Supreme Court ruling in July 1983. 54% of the exits received no MGT award.

These data, however, might be underestimating current MGT awards policy because: (1)for four months of fiscal year 1984, less than 4,500 days were awarded (August=0,September=0,October=2,450,January=1,798); (2) there is still a question of whether all MGT awards are being entered into CIMIS. History, then, does not provide a good predictor for future policy.

The model awards all new admissions 75 days. This is equivalent to 80% of the admissions receiving 90 days.

Revocation & Restoration of Time:

8% of the the fiscal year 1984 exits had time revoked. This is lower than the 14% in the model. For those who had some time revoked, 51% will have some restored, 31% with all time restored. At this point, the assumption is that these numbers represent current practice of revocation and restoration of time.

#### Exit Parameters

Determinate Sentences:

The projected exit date for mandatory supervised release from the information system (CIMIS) is used as the base to determine exits. Additional MGT awards are subtracted along with revocation and restoration of time to produce the month that an inmate will exit.

Indeterminate Sentences:

The difficulty in projecting indeterminate exits is the combination of uncertainty and lack of data.

Prisoner Review Board reports show that of 404 parole cases considered from January through June 1984, only 18 (4.5%) were granted parole. The 404 cases are broken down as follows:

|                          | Total Heard | Total Parole | Parole Rate |
|--------------------------|-------------|--------------|-------------|
| Action at Minimum        | 91          | 6            | 7%          |
| Action after Continuance | 363         | 12           | 3%          |

The problem lies in the fact that there is no data on how many hearings occurred prior to release.

The assumption in the model is that if a case has not reached his minimum he will be exited at that time. Otherwise, he will be exited at his discharge date. There were 1,113 indeterminates in the June 30, 1984, population. Of this number, 626 (56%) had not reached their minimum date. Of the 487 past their minimum date, 20% had a discharge date within the first 3 years and 62% with a discharge date within 10 years.

The assumption is underestimating length of stay for approximately 582 cases while probably overestimating for an estimated 400 cases. Although the assumption is not the most accurate, it is the best available.

Illinois Department of Corrections
Adult Population Projections
Special Report to the Members of the General Assembly
May 1985

#### Data Parameters for the Simulation Model

#### F ADM

 $1\ \text{X}\ 10$  Projected felony admissions for a 10 year period. Based upon demographic

#### M ADM

1 X 10

growth rate by sex and age groupings.

Projected misdemeanor admissions for a 10 year period. Not used because we no longer have misdemeanant admissions.

#### L ADM

1 X 10

Projected admissions with natural life, death, and SDP (Sexually Dangerous Person) sentences for a 10 year period. Assumes that these types of admissions will increase at same percentage as felony admissions.

#### MF PROB

1 X 12

Refers to the monthly cumulative distribution of felony admissions for a 10 year period. Distribution is determined by the number of Fridays in each month over a three year period.

#### MM PROB

1 X 12

Refers to the monthly cumulative distribution for misdemeanant admissions. Not used because we no longer have misdemeanant admissions.

#### ML PROB

1 X 12

Refers to the monthly cumulative distribution of admissions with life, death and SDP sentences. Same as MF\_PROB.

#### NL SMOS

This parameter will allow the phasing in of up to two new laws. It is not currently in use, pending further clarification from NCCD.

#### NL PHASE

This parameter will allow the phasing in of up to two new laws. It is not currently in use, pending further clarification from NCCD.

OFFGR F

3 X 10

Cumulative felony offense group (Murder, Class X, 1, 2, 3 and 4) distribution for each law.

SENT F
3 X 10 X 240
Cumulative felony sentence distribution (1-240 months) for each law by offense group.

SENT\_M
3 X 364
Cumulative misdemeanor sentence distribution (1-364 days) for each law.

OFFGR D  $\overline{3}$  X 10 Cumulative felony defaulter offense group distribution for each law.

SENT\_DF

3 X 10 X 240

Cumulative felony defaulter sentence distribution (1-240) for each law by offense group.

JAIL\_F
3 X 60
Cumulative felony jail credits distribution by law (0-59 months) by offense group.

JAIL M  $$^{3}$ \times 60$$  Cumulative misdemeanor jail credits distribution by law (0-59 months).

JAIL\_D

3 X 60

Cumulative defaulter with a new sentence jail credits distribution by law
(0-59 months) by offense group.

GTMISDEM

1 X 364

Good Time credits (in days) available for each possible misdemeanor sentence (1-364). Not used.

Illinois Department of Corrections
Adult Population Projections
Special Report to the Members of the General Assembly
May 1985

FCR PROB

10 X 36

Cumulative felony probation credits distribution (0-35 months) for each offense group.

MCR PROB

1 X 180

Cumulative misdemeanor probation credits distribution (0-179 days). Not used.

FGT RCH

1 X 1

Felony Good Time removal probability (chance). Represents the odds that a felon will have some Good Time revoked.

MGT RCH

1 X 1
Misdemeanor Good Time removal probability (chance). Not used.

FGT REM

1 X 60

Cumulative felony Good Time removal distribution (1-60 days per year).

MGT REM

1 X 60

Cumulative misdemeanor Good Time removal distribution (1-60 days per  $\underline{year}$ ). Not used.

FGT RES

1 X 100

Cumulative felony Good Time restoration probability distribution (chance for 1% or less restored, 2% or less, ...100% or less).

MGT RES

1 X 100

Cumulative misdemeanor Good Time restoration probability distribution (chance for 1% or less restored, 2% or less, ...100% or less).

PRIS F

1 X 1

Existing felony prison population (excluding lifers).

#### PRIS M

1 X 1

Existing misdemeanor prison population.

#### PRIS\_L

\_1 X 1

Existing lifer prison population, including death and SDP.

#### PRIS D

1 X 1

Existing defaulter w/o a new sentence prison population.

#### TIME F

Existing prison felony excluding lifers time left\* (cumulative) distribution for each offense group (0-120 months). Offense group includes Murder, X, 1, 2, 3, 4 and Indeterminates.

#### TIME MIS

1 X 364

Existing prison misdemeanor time left\* (cumulative) distribution (0-363 days).

#### TIME L

1 X 240

Existing prison lifer time left\* (cumulative) distribution (0-120 months).

#### **EXOFFGRP**

1 X 10

Existing prison felony (excluding lifers) offense group (cumulative) distribution. Creates the indeterminates as a separate offense group.

#### MP POP

1 X 1

Existing MSR/parole population.

#### TIME MP

1 X 60

Time left to serve distribution (cumulative distribution) for the existing MSR/parole population (0-59 months).

\*Time left is the time left on the <u>sentence</u> after jail credits, probation credits and Good Time earned, lost and restored (for time <u>already</u> spent) has been subtracted.

Illinois Department of Corrections
Adult Population Projections
Special Report to the Members of the General Assembly
May 1985

#### MF EXIT

1 X 4

MSR/parole cumulative exit probabilities, ( $^1$ discharge,  $^2$ discharge or defaulter w/o,  $^3$ discharge, def w/o or defaulter with a new sentence, and  $^4$ discharge, defaulter w/o def w or other).

#### MF TIME

3 X 12

MSR/parole time (in months) for each felony offense group (1-10), misdemeanors (11) and lifers (12), by law.

#### VRATE

1 X 1

MSR/parole violation rate.

#### TIME DEF

1 X 36

Time left to <u>serve</u> for existing prison defaulter without a new sentence. Cumulative distribution (0-35 months).

#### DEF TIME

1 X 36

Time to <u>serve</u> cumulative distribution for new defaulters w/o new sentences (1-36 months) (adjust for Good Time, etc.).

#### PREX DEF

1 X 3

Cumulative prison exit probabilities for defaulters w/o new sentences (<sup>1</sup>other, <sup>2</sup>other or supervision and <sup>3</sup>other, supervision or discharge).

#### DT LOST

1 X 25

Cumulative distribution on the amount of Good Time lost by a defaulter prior to returning to prison (0-24 months).

#### DEF\_WONS

1 X 3

Probability a defaulter will not have a new sentence.

#### NEW\_WONS

1 X 3

Probability a defaulter will have a new offense of life, death, or SDP.

#### **MEXDWO**

1 X 20

Probability a defaulter w/o a new sentence will spend less than or equal to 5% of his time on MSR/parole before returning to prison, less than or equal to 10%, 15%, ..., 95%, 100%).

#### MEXDW

X 20

Probability a defaulter with a new sentence will spend less than or equal to 5% of his time on MSR/parole before returning to prison, less than or equal to 10%, ..., 95%, 100%.

#### PREXIT

1 X 3

Cumulative prison exit probabilities (excluding defaulters w/o a new sentence) (¹other, ²other or parole, ³other, parole or discharge).

#### PREXOTH

1 X 20

Probability an "other" prison exit will spend less than or equal to 5% of his time in prison before exiting, less than or equal to 10%, ..., 95%, 100%.

#### MSREXIT

1 X 4

Supervision probability exit. (Same as MF EXIT.)

#### MEXOTH

1 X 20

Probability of other exits from supervision will spend less than or equal to 5% of his time on supervision before exiting, less than or equal to 10%...100%.

#### SEED

1 Y 1

Any 5, 5 or 7 digit odd integer.

## **CRIMINAL JUSTICE TRENDS**

- Crime Rates and Arrests
- Dispositions

### Criminal Justice System Trends

Department of Law Enforcement data indicate that from 1974 to 1980, major crimes reported to the police in downstate counties increased by 26%.

As of 1980, crime has been decreasing; from 1980 to 1983 crime fell by 12%. Crime decreased by 4% from 1982 to 1983, 8% from 1981 to 1982, and 3% from 1980 to 1981.

The Illinois Criminal Justice Information Authority reports that law enforcement officials generally agreed that increased citizen involvement in crime prevention programs, more patrols, aggressive prosecution by state's crime prevention programs, of offenders were major reasons for the attorneys, and tougher sentencing of offenders were major reasons for the recent decline.

Illinois Department of Corrections (IDOC) officials note that incarceration and demographic changes are also significant contributors to the decline.

The Administrative Office of the Illinois Courts reported that since 1974, dispositions of felony defendants charged with a felony increased by 73%, nearing 53,000 in 1983. Since 1980, despite a decline in reported crimes, dispositions increased 8% statewide.

In 1974, 44% of all dispositions resulted in a conviction. In 1983, 58% were convicted. The number of felony convictions rose by 125% in the 10-year period.

Convictions to prison have increased by 157% from 1974 to 1983. Most of these convictions (60%) have been for the more serious offenders, those convicted of Class M, X, 1, and 2 offenses.

Convictions to probation, including probation alone and a combination of probation and jail, have increased 109% from 1974 to 1983. These include some Class 1 and 2 offenders (34%), but are mostly Class 3 and 4 offenders.

This trend has resulted in an increased number of admissions to IDOC. In fiscal year 1983, 11,503 offenders were admitted to IDOC. Another 10,148 were admitted in fiscal year 1984. This represents a 13% increase over the prior three years.

The Illinois prison population is presently composed of more serious offenders than ever before. In fiscal year 1979, 49% of the inmates were convicted of a Class 1 or higher offense. As of fiscal year 1984, 61% of the population were in that category.

The increase in the more serious offenders in the prison population has resulted in increased sentence lengths of stay, thus keeping more offenders incarcerated for a longer period of time. The average sentence imposed for a Class X offense in 1978 was 9.5 years. In 1982, the average sentence for Class X offenses reached 12 years. Sentences for murder increased from 27.2 years in 1978 to 28.6 years in 1982.
