ACQUISITIONS

This document was prepared by the Community Research Center of the University of Illinois at Urbana-Champaign under contract No. J-012-81 awarded by the Office of Juvenile Justice and Delinquency Prevention, United States Department of Justice. Points of view or opinions stated in this document do not necessarily represent the official position of the U.S. Department of Justice.

March, 1984

Many young people are falling through the cracks in our social service system. A lack of coordinated service planning and follow-through, too few dollars allocated for social services, and a scarcity of innovative, community programs have helped to create gaps in our human services network. The high risk/high need youngster has become the victim of these shortcomings. While theories abound on the high risk/high need youth, very little empirical data is available to document the extent of the problem, or the needs of these youngsters.

In late spring of 1983, staff counsel for the West Virginia Supreme Court Juvenile Justice Committee drew together various groups and individuals from around the state who had demonstrated interest regarding the welfare of high risk/high need youngsters. The Claude Worthington Benedum Foundation awarded a six-month grant to the National Council of Jewish Women--West Virginia Section, Inc., on behalf of this group, to look closely at the high risk/high need youth population in West Virginia. Specifically, the Benedum proposal sought to determine the number of high risk/high need youths in the state, to develop a profile of these young people, and to explore existing, innovative program models for troubled youngsters. The information gleaned from the Study was to be shared with social service providers around the state, as well as agency administrators, program developers, legislators, and interested community members for their use in advocating and planning for the needs of these children.

The first part of the Study--the Nomination Phase--had as its goal to determine the number of high risk/high need youths in the state. Public agencies that work with children and adolescents were contacted by trained, community volunteers, to explain the Study and to disseminate the data collection instrument. Nomination Forms were distributed to the 55 county school boards, the 27 area offices of health centers (including satellite offices), private and public psychiatric hospitals having adolescent units, juvenile probation offices, and state juvenile correctional facilities. Workers from these agencies were asked to "nominate" as high risk/need any youth with whom they were currently working who met one or more of the criteria listed on the form. In all, over 6,000 blank forms were distributed around the state to youth workers from the above agencies.

Response to the Study from agency personnel was overwhelming. (See Tables I and II.) Over 90 percent of the agencies contacted chose to participate in the effort by either nominating youths from their caseloads, or indicating that none of their youths met the criteria. Analysis of the preliminary

results indicates that 2,309 completed nomination forms were received, representing a total of 2,084 high risk/high need youths.¹ (See Table III.)

A brief demographic analysis shows that approximately 70 percent of the nominees were male (see Table IV), and most (almost 76 percent) were between the ages of 14 and 17. By far, the largest percentage of youths were white (93.1 percent), with the remainder of the nominees either black, oriental, or other, or "race not reported." (See Table V).

The greatest number of nominations--42.3 percent of the total--were received from school personnel. Department of Human Services workers also nominated a significant percentage of high risk/high need children (31.4 percent). The remaining nominations were offered by therapists/counselors/psychologists at community mental health centers, West Virginia Supreme Court juvenile probation officers,² correctional facilities personnel, professionals working at private and public psychiatric hospitals, and health services employees. (See Table II.)

The second phase of the Study entailed profiling a select number of randomly chosen nominees, to develop a composite of the high risk/high need youth. The intent of the Personal Profile, the data gathering instrument used for this phase, was to personalize the nominees, to provide a glimpse past the demographic information of race, sex, and age, and develop a portrait of the individual child and his family. Of interest, was whether there were outstanding similarities in the backgrounds of high risk/high need youngsters, which might prove significant in developing intervention strategies for these children.

Based on preliminary findings of the Study, the following picture of the high risk/high need child emerges. The high risk/high need youth has spent most of his life with his natural family, has lived with at least one parent consistently, but has been left alone or unsupervised for large periods of time. (See Tables VI-VIII.) While a number of these children have never experienced a formal placement outside of their home, over half of the young people have had at least one, and sometimes many out-of-home placements. (See Tables IX

¹The difference of 225 nominees represents duplicate nominations--that is, more than one worker or agency completed forms on the same child, as evidenced by cross-tabulation indicators included for that purpose. All of the statistics appearing in this Executive Summary have been corrected for duplicates; the data will reflect information on the number of high risk/high need individuals, rather than the total number of nominations.

²In soliciting nominations from juvenile probation officers employed by the West Virginia Supreme Court, several counties were inadvertently excluded. Nominations from the following county probation offices (Supreme Court only) are missing: Berkeley, Boone, Logan and Wyoming.

and X.) The high risk/high need young person has friends, but is rarely involved in social activities, such as sports, school-related events, or recreation. They attend school, but have a number of school problems, including truancy, suspensions, and being held back grade levels. (See Table XI.) There is a good chance that the high risk/high need child will at some time enter a special education program, either for a learning disability, a behavior disorder, or both. It is unlikely that they will participate in vocational classes while enrolled in school. It is likely, however, that the youth will have some contact with the court for delinquency proceedings, whether for minor, or more serious, offenses. (See Table XII.)

High risk/high need youths are not alone with their problems. Too often, the family has a below average income, supporting between three to six people. The young person's brothers and sisters are likely to be experiencing the same troubles as they: school difficulties, court proceedings, out-of-home placements and, too often, abuse and neglect. Indeed, the child's problems are mirrored in the family--excessive use of alcohol or drugs, domestic violence, criminal proceedings. (See Tables XIII-XVI.)

Even more alarming than this bleak portrait of the high risk/high need youth is that while professionals who work with these young people are eager to ensure that their clients receive needed services, it is apparent that this is not happening. For example, when asked what general services were needed for an ideal rehabilitation plan for specific youths, 88.6 percent of the professional respondents noted that family therapy was needed. It was also reported by the respondents that family therapy was available in 93.7 percent of their communities. Yet, when asked whether family therapy had ever been utilized in these same cases, 53.4 percent of the youths had never been involved with family therapy, and only 10.5 percent were currently receiving family counseling services. Similar statistics can be cited for drug and alcohol services, vocational training, educational services, and individual counseling, among others. (See Table XVII.)

What, then, can and should be done to ensure that high risk/high need youths are not the victims of service gaps? While the results from the Study have been analyzed too recently to posit final recommendations, a few suggestions can be made. First, there must be more individualization of services. By this, a two-pronged approach is intended: (1) the high risk/high need youth must be viewed as an individual, with a service plan designed to meet the total needs of the child; and (2) programs must have an individualized approach to the youthful client, being flexible enough to meet the youth's needs, rather than expecting the young person to conform to the program's approach. Second, more coordination of services among agencies is crucial. The high risk/high need youth is often involved with more than one agency; service coordination is essential if consistency in planning, implementation, and follow-through are to be ensured. Third, communities must conduct a nondefensive, realistic analysis of the services available in the community, and examine the blockages which exist to receiving those services. Without careful analysis, services will continue to be seriously under-utilized by those who so desperately need them.

The West Virginia High Risk/High Need Youth Study should be viewed as a first step in developing an effective, service delivery system for troubled youngsters. Further cooperative efforts must be taken to ensure that the Study's results find application, rather than becoming yet another report with recommendations filed away for imagined future reference. To ensure that this does not happen, this Study brings with it the commitment of the individuals and organizations who made the proposal a reality.*

TABLE II
 NOMINATION FORM DATA: NUMBER AND
 PERCENTAGE OF NOMINEES BY NOMINATING AGENCY

	<u>Number of Nominees</u>	<u>Percentage of Nominees</u>
Schools	881	42.3
Human Services	655	31.4
Mental Health	271	13.0
Supreme Court	216	10.4
Correctional Facility	39	1.9
Psychiatric Hospital	20	1.0
Health Service	2	.1
TOTALS	2,084	100.0

TABLE III
NOMINATION FORM DATA: NUMBER AND PERCENTAGE OF NOMINEES BY CRITERIA

	<u>Number of Nominees</u>	<u>Percentage of Nominees</u>	<u>Number of Criteria Only Nominees</u>	<u>Percentage of Criteria Only Nominees</u>
Has had multiple suspensions, as evidenced by a history of suspensions (and still a problem) or suspensions recently increasing in number.*	1,264	60.7	320	15.4
Has been expelled from school during the last academic year.	467	22.4	43	2.1
Has a history of suicide attempts.	186	8.9	27	1.3
Has a history of prostitution.	117	5.6	10	.5
Has been formally diagnosed as having a psychotic disorder.	189	9.1	31	1.5
Has a significant problem with drugs or alcohol, as evidenced by multiple charges or convictions of driving under the influence (DUI), or intoxication, or possession, or evidence of chemical addiction or dependency.	576	27.6	65	3.1

*The large number of youths having experienced multiple suspensions from school suggests that this set of criteria, in and of itself, may not indicate a high risk/high need child. The total number of high risk/high need youths, as reported in this Study, would then be reduced by 320, the number of young people nominated for multiple suspensions only.

	<u>Number of Nominees</u>	<u>Percentage of Nominees</u>	<u>Number of Criteria Only Nominees</u>	<u>Percentage of Criteria Only Nominees</u>
Has a history of fire setting or charges of arson.	79	3.8	4	.2
Has a history of animal abuse.	62	3.0	5	.2
Has repeatedly run away from living situation with prolonged instances of living on the street.	668	32.1	79	3.8
Has a history of violent or serious assaultive behavior with or without the use of weapons	679	32.6	86	4.1
Has a history of multiple unsuccessful out-of-home placements.	<u>585</u>	<u>28.1</u>	<u>14</u>	<u>.7</u>
TOTALS	2,084	100.0	684	32.8
