Statistical Tables Describing the Characteristics
and Recidivism Rates of 1971 Releasees
from Massachusetts MCIs

Massachusetts Department of Correction

Frank A. Hall
Commissioner

August, 1974

Compiled by:
Daniel P. LeClair
Research Specialist

Division of Research and Planning

014907 cr

The Division of Research and Planning of the Massachusetts Department of Correction has recently completed a recidivism follow-up analysis of the 1971 releasees from the state correctional institutions. These statistics are available for men released from MCIs Walpole, Norfolk, Concord, and the three Forestry Camps (Monroe, Warwick and Plymouth); and for women released from MCI-Framingham. The data is currently being utilized to generate a full recidivism evaluation and to construct updated base expectancy prediction tables. However, in the interim period before the final completion of these studies, statistical tables on inmate characteristics and recidivism rates will be presented in this report.¹

There were 1,107 men and women released from state correctional institutions and Forestry Camps in 1971. A recidivist was defined as any subject who was returned to a Federal or State correctional institution or to a County House of Correction or Jail for 30 days or more. The follow-up period was one year from the date of the subjects' release to the community.

¹ The author would like to acknowledge his appreciation for the careful work that the following individuals provided in the collection and preparation of data to be used in these reports: Ira Baline, Donna Gurski, Denise Huffman, Carolyn Jackson, Russ Kerr, Joe Landolfi, Chris Mackey, Therese Pink, and Ellen Weiner. He would also like to thank Eleanor O'Brien for the careful typing of this report.

The tables that follow contain two types of information: (1) statistical data describing the characteristics of individuals released from each Massachusetts Correctional Institution in 1971; and (2) the rates of recidivism for these individuals. Thirtytwo background variables were utilized to provide a descriptive analysis of the 1971 releasee population. In addition, these variables provided a framework for a differential analysis of recidivism rates,

In reading the tables presented below, the reader should note that: (1) the total releasee population was subdivided according to the specific institution of release; (2) N represents the total number of individuals in the releasee population by institution who fall into the corresponding category in the table; (3) % represents the proportion of the number of individuals in a particular category by institution of release to the total number of releasees from that institution; and (4) Recidivism Rate (indicated as R.R. in the tables) represents the proportion of the total number of individuals in that category that have recidivated. The figure under the heading R.R. may also be read as the percentage of the total individuals in the particular category that have recidivated.

For example, in reading Table I presented on page 1, the variable commitment institution is presented and the following kinds of information can be obtained: The total releasee sample of 1,107 individuals has been broken down according to the institution from which they were released. This is labeled and presented horizontally across the head of the table. The institution of original commitment is labeled and presented vertically. Of the 1,107 individuals released in 1971, 155 were released from MCI-Walpole. Of the 155 individuals released from

Walpole, 150 (or 97%) were originally committed to MCI-Walpole; 5 (or 3%) to MCI-Concord; and none to MCI-Framingham. Those individuals committed to Walpole and released from Walpole had a recidivism rate of 27%, whereas those individuals released from Walpole but originally committed to MCI-Concord had a recidivism rate of 20%.
