Preface

Since early in the 1970's, victimization surveys have been carried out under the National Crime Survey (NCS) program to provide insight into the impact of crime on American society. As one of the most ambitious efforts yet undertaken for filling some of the gaps in crime data, the surveys, carried out for the Law Enforcement Assistance Administration (LEAA) by the U.S. Bureau of the Census, are supplying the criminal justice community with new information on crime and its victims, complementing data resources already on hand for purposes of planning, evaluation, and analysis. Based on representative sampling of households and commercial establishments, the program has had two major elements, a continuous national survey and separate surveys in 26 central cities across the Nation.

Based on a scientifically designed sample of housing units within each jurisdiction, the city surveys had a twofold purpose: the assessment of public attitudes about crime and related matters and the development of information on the extent and nature of residents' experiences with selected forms of criminal victimization. The attitude questions were asked of the occupants of a random half of the housing units selected for the victimization survey. In order to avoid biasing respondents' answers to the attitude questions, this part of the survey was administered before the victimization questions. Whereas the attitude questions were asked of persons age 16 and over, the victimization survey applied to individuals age 12 and over. Because the attitude questions were designed to elicit personal opinions and perceptions as of the date of the interview, it was not necessary to associate a particular time frame with this portion of the survey, even though some queries made reference to a period of time preceding the survey. On the other hand, the victimization questions referred to a fixed time frame—the 12 months preceding the month of interview—and respondents were asked to recall details concerning their experiences as victims of one or more of the following crimes, whether completed or attempted: rape, personal robbery, assault, personal larceny, burglary, household larceny, and motor vehicle theft. In addition, information about burglary and robbery of businesses and certain other organizations was gathered by means of a victimization survey of commercial establishments, conducted separately from the household

survey. A previous publication, *Criminal Victimization Surveys in Miami* (1977), provided comprehensive coverage of results from both the household and commercial victimization surveys.

Attitudinal information presented in this report was obtained from interviews with the occupants of 4,929 housing units (9,650 residents age 16 and over), or 97.3 percent of the units eligible for interview. Results of these interviews were inflated by means of a multistage weighting procedure to produce estimates applicable to all residents age 16 and over and to demographic and social subgroups of that population. Because they derived from a survey rather than a complete census, these estimates are subject to sampling error. They also are subject to response and processing errors. The effects of sampling error or variability can be accurately determined in a carefully designed survey. In this report, analytical statements involving comparisons have met the test that the differences cited are equal to or greater than approximately two standard errors; in other words, the chances are at least 95 out of 100 that the differences did not result solely from sampling variability. Estimates based on zero or on about 10 or fewer sample cases were considered unreliable and were not used in the analysis of survey results.

The 37 data tables in Appendix I of this report are organized in a sequence that generally corresponds to the analytical discussion. Two technical appendixes and a glossary follow the data tables: Appendix II consists of a facsimile of the survey questionnaire (Form NCS 6), and Appendix III supplies information on sample design and size, the estimation procedure, reliability of estimates, and significance testing; it also contains standard error tables.

IMPORTANT

We have provided an evaluation sheet at the end of this publication. It will assist us in improving future reports if you complete and return it at your convenience. It is postage-paid and needs no stamp.

II. Household respondent data: Standard error approximations for estimated percentages	52

Crime and attitudes

During the 1960's, the President's Commission on Law Enforcement and Administration of Justice observed that "What American does about crime depends ultimately upon how Americans see crime. . . . The lines along which the Nation takes specific action against crime will be those that the public believes to be the necessary ones." Recognition of the importance of societal perceptions about crime prompted the Commission to authorize several public opinion surveys on the matter.¹ In addition to measuring the degree of concern over crime, those and subsequent surveys provided information on a variety of related subjects, such as the manner in which fear of crime affects people's lives, circumstances engendering fear for personal safety, members of the population relatively more intimidated by or fearful of crime, and the effectiveness of criminal justice systems. Based on a sufficiently large sample, moreover, attitude surveys can provide a means for examining the influence of victimization experiences upon personal outlooks. Conducted periodically in the same area, attitude surveys distinguish fluctuations in the degree of public concern; conducted under the same procedures in different areas, they provide a basis for comparing attitudes in two or more localities. With the advent of the National Crime Survey (NCS) program, it became possible to conduct large-scale attitudinal surveys addressing these and other issues, thereby enabling individuals to participate in appraising the status of public safety in their communities.

Based on data from a 1974 attitudinal survey, this report analyzes the responses of Miami residents to questions covering four topical areas: crime trends, fear of crime, residential problems and lifestyles, and local police performance. Certain questions, relating to household activities, were asked of only one person per household (the "household respondent"), whereas others were administered to all persons age 16 and over ("individual respondents"), including the household respondent. Results were obtained for the total measured population and for several demographic and social subgroups.

¹President's Commission on Law Enforcement and Administration of Justice. *The Challenge of Crime in a Free Society*. Washington, D.C.: U.S. Government Printing Office, February 1967, pp. 49-53.

Conceptually, the survey incorporated questions pertaining to behavior as well as opinion. Concerning behavior, for example, each respondent for a household was asked where its members shopped for food and other merchandise, where they lived before moving to the present neighborhood, and how long they had lived at that address. Additional questions asked of the household respondent were designed to elicit opinions about the neighborhood in general, about the rationale for selecting that particular community and leaving the former residence, and about factors that influenced shopping practices. None of the questions asked of the household respondent raised the subject of crime. Respondents were free to answer at will. In contrast, most of the individual attitude questions, asked of all household members age 16 and over, dealt specifically with matters relating to crime. These persons were asked for viewpoints on subjects such as crime trends in the local community and in the Nation, chances of being personally attacked or robbed, neighborhood safety during the day or night, the impact of fear of crime on behavior, and the effectiveness of the local police. For many of these questions, response categories were predetermined and interviewers were instructed to probe for answers matching those on the questionnaire.

Although the attitude survey has provided a wealth of data, the results are opinions. For example, certain residents may have perceived crime as a growing threat or neighborhood safety as deteriorating, when, in fact, crime had declined and neighborhoods had become safer. Furthermore, individuals from the same neighborhood or with similar personal characteristics and/or experiences may have had conflicting opinions about any given issue. Nevertheless, people's opinions, beliefs, and perceptions about crime are important because they may influence behavior, bring about changes in certain routine activities, affect household security measures, or result in pressures on local authorities to improve police services.

The relationship between victimization experiences and attitudes is a recurring theme in the analytical section of this report. Information concerning such experiences was gathered with separate questionnaires, Forms NCS 3 and 4, used in administering the victimization component of the survey. Victimization survey results appeared in *Criminal Victimization Surveys in Miami (1977)*, which also contains a detailed description of the survey-measured crimes, a discussion of the limitations of the central city surveys, and facsimiles of Forms NCS 3 and 4. For the purpose of this report, individuals who were victims of the following crimes, whether completed or attempted, during

the 12 months prior to the month of the interview were considered "victimized": rape, personal robbery, assault, and personal larceny. Similarly, members of households that experienced one or more of three types of offenses—burglary, household larceny, and motor vehicle theft—were categorized as victims. These crimes are defined in the glossary. Persons who experienced crimes other than those measured by the program, or who were victimized by any of the relevant offenses outside of the 12-month reference period, were classified as "not victimized." Limitations inherent in the victimization survey—that may have affected the accuracy of distinguishing victims from nonvictims—resulted from the problem of victim recall (the differing ability of respondents to remember crimes) and from the phenomenon of telescoping (the tendency of some respondents to recount incidents occurring outside, usually before, the appropriate time frame). Moreover, some crimes were sustained by victims outside of their city of residence; these may have had little or no effect in the formation of attitudes about local matters.

Despite the difficulties in distinguishing precisely between victims and nonvictims, it was deemed important to explore the possibility that being a victim of crime, irrespective of the level of seriousness or the frequency of occurrence, has an impact on behavior and attitudes. Adopting a simple dichotomous victimization experience variable—victimized and not victimized—for purposes of tabulation and analysis also stemmed from the desirability of attaining the highest possible degree of statistical reliability, even at the cost of using these broad categories. Ideally, the victim category should have distinguished the type or seriousness of crimes, the recency of the events, and/or the number of offenses sustained.² Such a procedure seemingly would have yielded more refined measures of the effects of crime upon attitudes. By reducing the number of sample cases on which estimates were based, however, such a subcategorization of victims would have weakened the statistical validity of comparisons between the victims and nonvictims.

²Survey results presented in this report contain attitudinal data furnished by the victims of "series victimizations" (see glossary).

Nevertheless, it was the consensus that police services could be upgraded, mainly by increasing the size of the police force or by better deployment of available personnel. Compared with the total population, blacks were more likely to give the police poor ratings and to call for improvements in community relations.

Summary

Most residents of Miami shared the belief that crime in the Nation had increased during the year or two prior to the survey and that their chances of falling victim to violent attack had also risen. Furthermore, when asked to assess the impact of crime on personal activity, more than three-fourths said fear of attack had affected American lives.

Miamians appeared to be less concerned about crime in their own neighborhoods. Only about one-fourth believed crime to be on the increase in the vicinity of their homes, and most regarded the neighborhood as safer than others in the metropolitan area. In addition, fewer than 1 in 5 household respondents identified crime as the most serious neighborhood problem. Given such opinions, it is not surprising that nearly all residents said they felt at least reasonably safe when out alone in the neighborhood during the day. However, the hours after dark appeared to cause greater insecurity: 38 percent of the people felt at least moderately unsafe at night. As for the perpetrators of neighborhood crime, outsiders were more frequently blamed than neighboring residents.

Queried about the effect of crime on their own lives, fewer than half of Miami's residents said they had limited or changed their activities. And when it came to specific activities such as dining out or going to a theater, crime or fear of crime was rarely mentioned as an important consideration. Furthermore, crime was not the major reason given for moving from an old neighborhood, selecting a new one, or shopping at a particular location.

Opinions about crime were generally homogeneous across all sectors of the population, although there were often differences in the strength of viewpoints. To illustrate, most individuals, regardless of their race or experience with crime, believed their neighborhood to be safer than others in the Miami area, yet whites or nonvictims were more likely than blacks or victims to share this belief. Similarly, men or younger persons tended to feel more secure than others when out alone in the neighborhood, and nonvictims were more likely than victims to hold outsiders responsible for neighborhood crime.

Local law enforcement authorities were judged to be good or average by a majority of the population.

Crime trends

This section of the report deals with the perceptions of Miami residents with respect to national and community crime trends, personal safety, and the accuracy with which newspapers and television were thought to be reporting the crime problem. The findings were drawn from Data Tables 1 through 6, found in Appendix I. The relevant questions, appearing in the facsimile of the survey instrument (Appendix II), are 9a, 9c, 10a, 12, 15a, and 15b; each question was asked of persons age 16 and over.

U.S. and neighborhood crime trends

Most residents of Miami age 16 and over believed crime was on the upswing throughout the United States. Seven-tenths of the population said that there had been an increase in crime in the year or two prior to the survey, 16 percent believed crime remained about the same, and 5 percent suggested it was on the decline. Of the remainder, 9 percent did not have an opinion and fewer than 1 percent did not respond. When asked about the direction of crime in their own neighborhoods, people were somewhat less concerned. Those who believed neighborhood crime was on the increase comprised a much smaller proportion of the population (27 percent) than for the question on national crime, whereas a much larger number (45 percent) believed there was no change. As before, however, few persons (7 percent) thought crime was on the decline. A sizeable number of persons did not know or declined to respond because they were relative newcomers to the neighborhood.

Opinions about national and local crime trends showed little variation among persons of different sex or age. As for race, blacks were more apt than whites to regard crime as a growing threat to the local community. There were, in addition, noticeable differences of opinion between individuals who had fallen victim to a personal or household crime during the 12 months leading up to the interview and those who had not. Victimized individuals were more likely than nonvictims to believe crime had increased, both in the Nation (76 vs. 68 percent) and in the neighborhood (37 vs. 25 percent).

That residents tended to regard their own vicinities as relatively secure against crime was further illus-

trated when they were asked to compare neighborhoods within the Miami metropolitan area. Sixty-two percent of the populace believed their own communities to be less or much less dangerous than others in the city, 31 percent regarded them as average, and only 6 percent considered them to be more or much more dangerous. The modal (most common) response was "less dangerous" (46 percent), whereas the most uncommon was "much more dangerous" (1 percent). There were statistically significant variations in the distribution of responses for different types of individuals; however, in no group was the proportion of persons who perceived their neighborhoods as worse than average greater than 11 percent, the figure applicable to victimized individuals. Thus, it appeared that few people felt so endangered in their own communities that they rated them as less secure than others. Differences of opinion were more likely to have involved the "about average," "less dangerous," and "much less dangerous" categories. To illustrate, two-thirds of Miami's white population, but only two-fifths of the black population, regarded their vicinities as less or much less dangerous than others; blacks, on the other hand, had a far higher proportion of "about average" responses than whites (52 vs. 26 percent). In addition, persons age 35 and over, taken as a group, or those who had not been victimized in the preceding year were more likely than their counterparts to regard their communities as less or much less dangerous.

Who are the offenders?

Along with questions concerning crime trends and relative neighborhood safety, Miami residents were asked about the place of residence of offenders, specifically whether most neighborhood crimes were thought to be the work of persons living within or outside the vicinity. It is important to note that a fairly large number of individuals, 16 percent of the total measured population, indicated that crimes were not happening in the neighborhood—whites, persons over the age of 34, or nonvictims being more likely than others to feel this way—and 24 percent did not know whom to blame. Forty-three percent of the residents, the largest single group, stated that outsiders were the malefactors, whereas 10 percent singled out neighborhood residents, and 6 percent held outsiders and people from the vicinity equally responsible. Therefore, a majority of those persons who recognized the existence of neighborhood crime and had an opinion about the identity of the perpetrators blamed outsiders, a finding that held for all the measured subgroups. Nonetheless, persons who had firsthand experience as victims of

crime, but were not necessarily victimized in the neighborhood or had not necessarily seen the offenders, blamed local residents relatively more often than nonvictims and were less likely to contend there was no crime in the neighborhood or to have no opinion on the subject.

One-fourth of all blacks, compared to only 6 percent of whites, attributed neighborhood crime to local residents. Taken as a group, younger persons (age 16-34) were much more likely than older persons to blame community members. These relationships no doubt relate to findings of the victimization component of the survey, which determined that blacks or younger persons had higher victimization rates for crimes of violence (i.e., rape, robbery, and assault) than other persons.³

Chances of personal victimization

When the issue of personal vulnerability was raised, 53 percent of the residents of Miami said their chances of being attacked or robbed had gone up over the past few years, 32 percent felt the odds were about the same, and 8 percent believed the risk had diminished. Although the most common reply in each of the measured subgroups was that personal vulnerability had increased, there were variations in the size of this response. For example, 61 percent of all victims compared with 51 percent of nonvictims believed their chances of attack had risen. However, whites or females, groups with relatively low victimization rates for personal crimes of violence, were more likely to perceive a higher level of risk than blacks or males, groups with comparatively high rates of victimization. Surprisingly, age did not appear to be related to perceptions of personal vulnerability.

Crime and the media

In recent years the public has become increasingly critical of newspaper and television coverage of the news. Critics have charged that newspapers and television have portrayed American society only at its worst, and that coverage is often distorted or one-sided. With regard to the reporting of crime, however, Miami residents were not overly critical of the media; half of the population stated that the crime problem was about as serious as portrayed by the newspapers and television, 32 percent believed the problem to be even more serious than reported, and 11 percent suggested its graveness had been exaggerated by the coverage.

³United States. National Criminal Justice Information and Statistics Service. *Criminal Victimization Surveys in 13 American Cities*. Washington, D.C.: U.S. Government Printing Office, June 1975, p. 93.

These attitudes were generally homogeneous, although a slightly higher percentage of victims or blacks, compared with nonvictims or whites, considered crime a more serious problem than reported by the media.

Fear of crime

Among other things, results covered thus far have shown that many residents of Miami believed crime had increased over the years leading up to the survey, and, in addition, felt their own chances of being attacked or robbed had risen. Whether or not they feared for their personal safety is a matter treated in this section of the report. Also examined is the impact of the fear of crime on activity patterns and on considerations regarding changes of residence. Survey questions 11a, 11b, 11c, 13a, 13b, 16a, 16b, and 16c—all asked of persons age 16 and over—and Data Tables 7 through 18 are referenced here.

Crime as a deterrent to mobility

Individuals were asked if there were certain areas of Miami where they had reason to go or would like to go but were afraid to do so because of crime. Seventy-two percent of the measured population stated that during the daytime they were not afraid to travel to other areas, and one-fifth expressed some apprehension.⁴

Time of day appeared to be an important consideration in assessing the danger of traveling to other neighborhoods. When residents were asked about the evening hours, three-fifths of the population, a somewhat lower proportion than was registered for the previous question, said they did not fear moving about. This disparity between responses for the daytime and nighttime questions held for all demographic subcomponents and for both victims and nonvictims.

Although the majority believed there was little to fear from traveling about the city in either the daytime or at night, the proportion of persons who felt this way varied among the measured subgroups. The disparity between racial groups was the most pronounced, with blacks being less fearful than whites of moving about when the need or wish arose. Approximately 81 percent of blacks, compared with 69 percent of whites,

⁴As indicated previously, respondents were not queried regarding all parts of the metropolitan area but only about those they *needed* or *desired* to enter. Thus, it is reasonable to assume that high risk places, those most highly feared, were excluded from consideration by many respondents. Had the questions applied unconditionally to all sectors of the area, the pattern of responses no doubt would have differed.

stated they were not fearful during the daytime; for nighttime, the comparable figures were 68 and 59 percent, respectively. Men gave a somewhat higher proportion of "no fear" responses than women for both day and night, whereas nonvictims were shown to be less fearful than victims only during nighttime.

Among persons under age 65 there appeared to be a greater reluctance to travel to other neighborhoods during the day as age increased, although statistical significance was not always forthcoming. Surprisingly, however, the proportion of elderly persons (age 65 and over) who said they were not afraid to move about the city during the day or at night was higher than the norm. That the elderly showed evidence of being less apprehensive than others is quite remarkable in view of the fact that they were generally considered to be more fearful than younger people. The possibility exists that this finding is an artifact of question design and not a true indication of disparate attitudes. As suggested before, the neighborhoods under consideration were those the respondent wanted or needed to enter, and it is not unlikely that the areas assessed varied with age. Persons age 65 and over may well have considered only a few regularly visited neighborhoods which they regarded as safe, whereas younger persons may have passed judgment on a wider variety of places.

Neighborhood safety

An additional measure of the impact of crime on attitudes was obtained from a question concerning personal safety within the neighborhood. During the daytime, 51 percent of the residents believed themselves to be very safe when out alone in the local community, 40 percent felt reasonably safe, 7 percent somewhat unsafe, and only 2 percent very unsafe.

A general feeling of security was in evidence for all the identifiable subgroups, even though the degree of safety perceived sometimes varied significantly. For example, 62 percent of Miami's male population considered themselves to be very safe but only 43 percent of females felt the same way. By contrast, 45 percent of all women as opposed to 33 percent of men felt reasonably safe; response differences between the sexes existed for both races and most age groups. Regarding age, sizeable variations were evident only between the youngest and oldest respondents. Of persons age 16-19, 54 percent felt very safe and 37 percent felt reasonably safe, whereas 88 percent of the responses by individuals age 65 and over were equally divided between those two categories.

As was the case with fear of traveling to other neighborhoods, the nighttime period caused greater fear of attack than the daytime. Overall, 23 percent felt very

Crime as a cause for moving away

Notwithstanding the fact that many Miami residents questioned the safety of their own neighborhoods, particularly during nighttime, few individuals were so concerned about crime that they seriously thought about leaving the area. Only 19 percent of the residents who felt at least somewhat unsafe either in the day or at night (or both) considered moving somewhere else. Paradoxically, women or older individuals—those who were more likely to express misgivings about the safety safe at night, 39 percent felt reasonably safe, 22 percent somewhat unsafe, and 17 percent very unsafe. Perhaps the most significant finding was that 38 percent of the population, about four times the number recorded in the previous question, considered their own neighborhoods to be at least somewhat unsafe at night. Not unexpectedly, a higher proportion of victims than nonvictims said they felt somewhat or very unsafe when out alone at night.

Roughly half of Miami's women, compared to only one-fourth of its men, regarded the condition of their neighborhoods at night as somewhat or very unsafe. The disparity between the sexes for those maintaining they felt very unsafe was even more marked: 23 percent of all women but only 8 percent of men said they felt that way.

Although roughly comparable proportions of whites and blacks felt either reasonably safe or somewhat unsafe in their neighborhoods at night, there were differences of opinion involving the two alternative responses, i.e., the "very safe" and "very unsafe" categories. "Very safe" responses were registered by 24 percent of whites as opposed to 15 percent of blacks, and these percentages were reversed for the "very unsafe" category.⁵ At most age levels, therefore, blacks were more likely than whites to express some degree of insecurity about nighttime safety, and, conversely, less likely to feel at least somewhat secure. This pattern maintained for females; among males of each race, however, significant response differences existed only for persons age 35-49 and 50-64.

Age by itself was not a particularly useful indicator of response variability; only for persons age 65 and over was there appreciable deviation from the norm. Of these elderly persons, 48 percent felt at least somewhat unsafe when out alone in the neighborhood at night, compared to 38 percent for all persons measured.

⁵For the remainder of this topic, responses of "very safe" and "reasonably safe" were combined and compared with the sum of "somewhat unsafe" and "very unsafe" answers.

of their neighborhoods—were less apt than men or younger persons (age 16–34) to have considered relocating.⁶ By contrast, blacks or victims of crime, groups exhibiting relatively more apprehension than whites or nonvictims, were also more likely to have thought of moving. In this regard, racial disparities were the most striking: 29 percent of blacks compared with 16 percent of whites said a move had been contemplated.

Crime as a cause for activity modification

Although moving out of a community must be regarded as a relatively drastic preventive measure, there are many other less extreme steps individuals may take to reduce the threat of criminal victimization, including modifications in customary activities. Residents were asked if they thought people in general or people in their own neighborhood had limited or changed their activities in the recent past, or if they themselves had altered their way of living because of their fear of crime. Some four-fifths of respondents believed people in general had changed their lives in an effort to reduce a perceived threat. When asked to consider their neighbors, however, a much smaller proportion, 51 percent, felt there had been some change. This decline in the proportion perceiving change, as the group in question became more identifiable, appeared to be consistent with findings from the previous section which showed that Miami residents believed crime to be more of a problem in the Nation as a whole than in their own communities. The trend was completed, when residents were asked to consider their own activity patterns; 45 percent said they had altered their lifestyle because of fear of crime and 55 percent said they had not. Thus, the results from this series of questions show that residents of Miami believed fear of crime had a greater impact on “others,” be they people in general or neighbors, than on themselves.⁷

The impact of fear of crime on personal activity varied among subgroups. Sex was possibly the most important variable in this regard; roughly half of all

women but only 37 percent of men said they had limited or changed their activities because of the fear of crime, with significant differences existing at each age level. Furthermore, irrespective of age, white females were more likely than white males to have reordered their activities, but for blacks the differences were statistically valid only for persons in groups between the ages of 20 and 49. Compared with white residents, blacks more frequently changed their activities in reaction to fear of crime, a relationship that prevailed for most age groups. And, although differences between matching sex-age groupings were not always statistically significant, it appeared that a higher proportion of black males or females than their white counterparts had altered their personal activities.

Residential problems and lifestyles

The initial attitude survey questions were designed to gather information about certain specific behavioral practices of Miami householders and to explore perceptions about a wide range of community problems, one of which was crime. As indicated in the section entitled “Crime and Attitudes,” certain questions were asked of only one member of each household, known as the household respondent. Information gathered from such persons is treated in this section of the report and found in Data Tables 19 through 26; the pertinent data were based on survey questions 2a through 7b. In addition, the responses to questions 8a through 8f, relating to certain aspects of personal lifestyle, also are examined in this section; the relevant questions were asked of all household members age 16 and over, including the household respondent, and the results are displayed in Data Tables 27 through 30. As can be seen from the questionnaire, and unlike the procedure used in developing the information discussed in the two preceding sections of this report, the questions that served as a basis for the topics covered here did not reveal to respondents that the development of data on crime was the main purpose of the survey.

Neighborhood problems and selecting a home

At the start of the survey, members of households situated at the same address 5 years or less were asked what had been the reasons for leaving their former

⁶Based on responses shown in Data Table 15, this observation is somewhat misleading because the source question was asked only of persons who said they felt unsafe during daytime and/or nighttime. Totalling 38 percent of the relevant population, individuals who were asked the question included 24 percent of all males, contrasted with 50 percent of all females. Thus, 7 percent of the total population age 16 and over—including 6 percent of males and 8 percent of females—said they had seriously considered moving.

⁷Similar findings were reported in Garofalo, James. National Criminal Justice Information and Statistics Service. *Public Opinion about Crime: The Attitudes of Victims and Nonvictims in Selected Cities*.

home and for moving into their present location. Respondents who volunteered more than one answer to each query were asked to pick the most important one. For both inquiries, crime was mentioned by only a small number of respondents; 2 percent suggested that crime was the major reason they left their former place of residence and 4 percent said safety from crime was of prime consideration in selecting the present neighborhood. Responses that might have incorporated concern over antisocial activities, such as "good schools," "neighborhood characteristics," or "influx of bad elements," were also relatively uncommon. Factors such as location and the characteristics of the old and new dwellings were much more important considerations.

Asked about conditions in the neighborhood, some seven-tenths of all household respondents stated there were no undesirable features, whereas 30 percent identified one or more areas of concern. Seventeen percent of persons in the latter group considered crime the most serious issue and another one-fourth identified matters possibly related to crime, such as problem neighbors and the influx of an undesirable element. Environmental problems such as trash, noise, and congestion were most bothersome to 37 percent of the respondents.

Food and merchandise shopping practices

To most householders, food shopping surely must rank as one of the most important activities performed on a regular basis. In response to a question concerning major food shopping practices, some four-fifths of the household respondents said they shopped in their own communities, and 18 percent, including a disproportionately large number of blacks, said they shopped elsewhere. Crime or fear of crime was infrequently cited as the major reason for shopping outside the neighborhood; more often than not, factors such as the absence of neighborhood stores or their inadequacy were given as the most important reasons.

As for other kinds of shopping, such as for clothing and general merchandise, most respondents (67 percent) usually preferred to go to neighborhood or suburban stores, whereas a minority preferred the downtown area. Only 8 percent of the respondents who shopped in the neighborhood or went to the suburbs did so primarily because they feared criminal attack downtown. Convenience or better selection were commonly cited as the major reasons for choosing a particular area.

Entertainment practices

Questions pertaining to evening entertainment patterns—the frequency with which people went out and the location of the establishments—were asked of all respondents. Sixty-four percent of the population went out in the evening with the same regularity they had a year or two previously, 26 percent had reduced their activities, and 10 percent went out more often. The most common reason given for curtailing evening entertainment, accounting for about one-fourth of the total, was lack of money. About one-tenth of the residents who had cut back did so primarily because they feared crime; not surprisingly, crime or fear of crime was rarely cited as a reason for increasing activities.

Theaters and restaurants inside the city were preferred by three-fourths of the residents, whereas 14 percent said they went outside the city and 11 percent patronized establishments in both areas. Some 14 percent of those who went outside the city and far fewer of those who remained in the city cited crime as the major reason.

Local police performance

Following the series of questions concerning neighborhood safety and crime as a deterrent to personal mobility, individuals age 16 and over were asked to assess the overall performance of the local police and to suggest ways, if any, in which police effectiveness might be improved. Data Tables 31 through 37, derived from survey questions 14a and 14b, contain the results on which this discussion is based.

Are they doing a good, average, or poor job?

As determined by the survey, the public's assessment of the Miami police was positive, if not overwhelmingly favorable. Some 43 percent of the measured population believed the local authorities were doing a good job and 37 percent an average job, whereas only 12 percent rated police performance as poor. This finding appears to indicate that concern over rising crime rates and increasing personal vulnerability had not translated into criticism of the municipal police. But there were differences of opinion in this regard, particularly between the races. Whites exhibited a much more favorable view of their local police than blacks; nearly half of all whites said the police were doing a good job, one-third an average job, and one-

tenth a poor job, whereas only one-fourth of blacks rated them as good, one-half as average, and about one-fifth as poor. With few exceptions racial disparities retained their significance across sex-age categories.

With respect to age, younger persons were more critical of the police than older persons. Of persons age 16-34, 34 percent regarded police performance as good, 46 percent as average and 15 percent as poor; among individuals age 35 and over the comparable proportions were 48, 32, and 11. As a rule, younger persons of either race and sex were less favorably disposed toward the police than other residents, but differences were not always statistically significant because of the small size of the groups on which the estimates were based.

Although the relationship between citizen contact with the criminal justice system and attitudes toward the police was not directly examined, victimized individuals, many of whom came into contact with the police as a result of their experience with crime, exhibited a lower opinion of the police than nonvictims. Whereas 34 percent of those affected by crime rated the police favorably, 46 percent of the nonvictims responded in that fashion. In addition, victims were somewhat more likely than nonvictims to regard police performance as poor.

How can the police improve?

Irrespective of what they thought of police performance, Miami residents were inclined to believe police effectiveness could be improved. Only 12 percent of individuals asked about ways to improve the force replied that no improvement was needed. Blacks (8 percent) or persons who had suffered a victimization (10) were somewhat less likely than others to hold this view.

A variety of specific suggestions were made concerning the most important way to upgrade police performance, but only a few were regularly cited. The most frequently voiced opinion was that more police were needed (37 percent) and that additional police should be used in certain areas and at certain times of the day (19 percent). Other suggestions, each accounting for roughly a tenth of the responses, included improving responsiveness and placing emphasis on more important duties, such as crime prevention.

Recommendations that focused upon improving personnel resources or operational practices accounted for some 86 percent of the responses.⁸ Nine percent of the residents cited a need for improving community relations, and 5 percent had other unspecified responses.

White and black residents appeared to be at odds over the best way to upgrade police performance. Nearly half of all whites but only a fifth of all blacks considered an increase in the size of the local force or improvement in the quality of personnel to be the most important considerations. Blacks, by contrast, were more likely than whites to call for a change in operational practices or for better community relations. Within the latter category, 13 percent of blacks specifically mentioned the development of a more courteous attitude and 9 percent felt the police should stop discriminating; the corresponding figures for whites were 4 and 1 percent. Finally, persons age 35 and over or nonvictims were more likely than younger persons or victims, respectively, to regard improvements relating to personnel resources as crucial, but were less apt to suggest measures concerning operational practices or community relations.

⁸The eight specific response items covered in Question 14b were combined into three categories, as follows: *community relations*: (1) "Be more courteous, improve attitude, community relations" and (2) "Don't discriminate." *Operational practices*: (1) "Concentrate on more important duties, serious crime, etc."; (2) "Be more prompt, responsive, alert"; (3) "Need more traffic control"; and (4) "Need more policemen of particular type (foot, car) in certain areas or at certain times." And, *personnel resources*: (1) "Hire more policemen" and (2) "Improve training, raise qualifications or pay, recruitment policies."

Survey data tables

The 37 statistical data tables in this appendix present the results of the Miami attitudinal survey conducted early in 1974. They are organized topically, generally paralleling the report's analytical discussion. For each subject, the data tables consist of cross-tabulations of personal (or household) characteristics and the relevant response categories. For a given population group, each table displays the percent distribution of answers to a question.

All statistical data generated by the survey are estimates that vary in their degree of reliability and are subject to variances, or errors, associated with the fact that they were derived from a sample survey rather than a complete enumeration. Constraints on interpretation and other uses of the data, as well as guidelines for determining their reliability, are set forth in Appendix III. As a general rule, however, estimates based on zero or on about 10 or fewer sample cases have been considered unreliable. Such estimates, qualified by footnotes to the data tables, were not used for analytical purposes in this report.

Each data table parenthetically displays the size of the group for which a distribution of responses was calculated. As with the percentages, these base figures are estimates. On tables showing the answers of individual respondents (Tables 1-18 and 27-37), the figures reflect an adjustment based on an independent post-Census estimate of the city's resident population. For data from household respondents (Tables 19-26), the bases were generated solely by the survey itself.

A note beneath each data table identifies the question that served as source of the data. As an expedient in preparing tables, certain response categories were reworded and/or abbreviated. The questionnaire facsimile (Appendix II) should be consulted for the exact wording of both the questions and the response categories. For questionnaire items that carried the instruction "Mark all that apply," thereby enabling a respondent to furnish more than a single answer, the data tables reflect only the answer designated by the respondent as being the most important one rather than all answers given.

The first six data tables were used in preparing the "Crime Trends" section of the report. Tables 7-18 relate to the topic "Fear of Crime"; Tables 19-30 cover "Residential Problems and Lifestyles"; and the last seven tables display information concerning "Local Police Performance."

65 and over (1,700)	100.0	25.7	61.1	13.2	¹ 0.0

NOTE: Data based on question 14b. Detail may not add to total because of rounding. Figures in parentheses refer to population in the group.

¹ Estimate, based on zero or on about 10 or fewer sample cases, is statistically unreliable.

Survey instrument

Form NCS 6, the attitude survey instrument, contains two batteries of questions. The first of these, covering items 1 through 7, was used to elicit data from a knowledgeable adult member of each household (i.e., the household respondent). Questions 8 through 16 were asked directly of each household member age 16 and over, including the household respondent. Unlike the procedure followed in the victimization component of the survey, there was no provision for proxy responses on behalf of individuals who were absent or incapacitated during the interviewing period.

Data on the characteristics of those interviewed, as well as details concerning any experiences as victims of the measured crimes, were gathered with separate instruments, Forms NCS 3 and 4, which were administered immediately after NCS 6. Following is a facsimile of the latter questionnaire; supplemental forms were available for use in households where more than three persons were interviewed. Facsimiles of Forms NCS 3 and 4 have not been included in this report, but can be found in *Criminal Victimization Surveys in Miami, 1977*.

HOUSEHOLD ATTITUDE QUESTIONS

Ask only household respondent

Before we get to the major portion of the survey, I would like to ask you a few questions related to subjects which seem to be of some concern to people. These questions ask you what you think, what you feel, your attitudes and opinions.

- 320 1. How long have you lived at this address?
1 Less than 1 year
2 1-2 years
3 3-5 years
4 More than 5 years - SKIP to 5a
- 321 2a. Why did you select this particular neighborhood? Any other reason? (Mark all that apply)
1 Neighborhood characteristics - type of neighbors, environment, streets, parks, etc.
2 Good schools
3 Safe from crime
4 Only place housing could be found, lack of choice
5 Price was right
6 Location - close to job, family, friends, school, shopping, etc.
7 House (apartment) or property characteristics - size, quality, yard space, etc.
8 Always lived in this neighborhood
9 Other - Specify _____
- (If more than one reason)
322 b. Which reason would you say was the most important?
Enter item number _____
- 323 3a. Where did you live before you moved here?
1 Outside U.S.
2 Inside limits of this city
3 Somewhere else in U.S. - Specify _____
- State _____
County _____
- 324 b. Did you live inside the limits of a city, town, village, etc.?
1 No
2 Yes - Enter name of city, town, etc. _____
- 325

- * 4a. Why did you leave there? Any other reason? (Mark all that apply)
- 326 1 Location - closer to job, family, friends, school, shopping, etc., here
2 House (apartment) or property characteristics - size, quality, yard space, etc.
3 Wanted better housing, own home
4 Wanted cheaper housing
5 No choice - evicted, building demolished, condemned, etc.
6 Change in living arrangements - marital status, wanted to live alone, etc.
7 Bad element moving in
8 Crime in old neighborhood, afraid
9 Didn't like neighborhood characteristics - environment, problems with neighbors, etc.
10 Other - Specify _____

(If more than one reason)

b. Which reason would you say was the most important?

327 _____ Enter item number

5a. Is there anything you don't like about this neighborhood?

- 328 0 No - SKIP to 6a
Yes - What? Anything else? (Mark all that apply)
- 329 * 1 Traffic, parking
2 Environmental problems - trash, noise, overcrowding, etc.
3 Crime or fear of crime
4 Public transportation problem
5 Inadequate schools, shopping facilities, etc.
6 Bad element moving in
7 Problems with neighbors, characteristics of neighbors
8 Other - Specify _____

(If more than one answer)

b. Which problem would you say is the most serious?

330 _____ Enter item number

6a. Do you do your major food shopping in this neighborhood?

- 331 0 Yes - SKIP to 7a
No - Why not? Any other reason? (Mark all that apply)
- 332 * 1 No stores in neighborhood, others more convenient
2 Stores in neighborhood inadequate, prefers (better) stores elsewhere
3 High prices, commissary or PX cheaper
4 Crime or fear of crime
5 Other - Specify _____

(If more than one reason)

b. Which reason would you say is the most important?

333 _____ Enter item number

7a. When you shop for things other than food, such as clothing and general merchandise, do you USUALLY go to suburban or neighborhood shopping centers or do you shop "downtown"?

- 334 1 Suburban or neighborhood
2 Downtown

b. Why is that? Any other reason? (Mark all that apply)

- 335 * 1 Better parking, less traffic
2 Better transportation
3 More convenient
4 Better selection, more stores, more choice
5 Afraid of crime
6 Store hours better
7 Better prices
8 Prefers (better) stores, location, service, employees
9 Other - Specify _____

(If more than one reason)

c. Which one would you say is the most important reason?

336 _____ Enter item number

INTERVIEWER - Complete interview with household respondent, beginning with Individual Attitude Questions.

INDIVIDUAL ATTITUDE QUESTIONS - Ask each household member 16 or older

KEYER - BEGIN NEW RECORD

337 Line number _____ Name _____

338 8a. How often do you go out in the evening for entertainment, such as to restaurants, theaters, etc.?
 1 Once a week or more
 2 Less than once a week - more than once a month
 3 About once a month
 4 2 or 3 times a year
 5 Less than 2 or 3 times a year or never

b. Do you go to these places more or less now than you did a year or two ago?
 1 About the same - SKIP to Check Item A
 2 More
 3 Less
 Why? Any other reason? (Mark all that apply)

340
 1 Money situation
 2 Places to go, people to go with
 3 Convenience
 4 Health (own)
 5 Transportation
 6 Age
 7 Family reasons (marriage, children, parents)
 8 Activities, job, school
 9 Crime or fear of crime
 10 Want to, like to, enjoyment
 11 Other - Specify _____

(If more than one reason)

341 c. Which reason would you say is the most important?

 Enter item number _____

CHECK ITEM A
 Is box 1, 2, or 3 marked in 8a?
 No - SKIP to 9a Yes - ASK 8d

342 d. When do you go out to restaurants or theaters in the evening, is it usually in the city or outside of the city?
 1 Usually in the city
 2 Usually outside of the city
 3 About equal - SKIP to 9a

e. Why do you usually go (outside the city/in the city)? Any other reason? (Mark all that apply)

343
 1 More convenient, familiar, easier to get there, only place available
 2 Parking problems, traffic
 3 Too much crime in other place
 4 More to do
 5 Prefer (better) facilities (restaurants, theaters, etc.)
 6 More expensive in other area
 7 Because of friends, relatives
 8 Other - Specify _____

(If more than one reason)

344 f. Which reason would you say is the most important?

 Enter item number _____

345 9a. Now I'd like to get your opinions about crime in general. Within the past year or two, do you think that crime in your neighborhood has increased, decreased, or remained about the same?
 1 Increased
 2 Decreased
 3 Same - SKIP to c
 4 Don't know - SKIP to c
 5 Haven't lived here that long - SKIP to c

b. Were you thinking about any specific kinds of crimes when you said you think crime in your neighborhood has (increased/decreased)?
 0 No Yes - What kinds of crimes? _____

347 c. How about any crimes which may be happening in your neighborhood - would you say they are committed mostly by the people who live here in this neighborhood or mostly by outsiders?
 1 No crimes happening in neighborhood
 2 People living here
 3 Outsiders
 4 Equally by both
 5 Don't know

348 10a. Within the past year or two do you think that crime in the United States has increased, decreased, or remained about the same?
 1 Increased } ASK b
 2 Decreased } ASK b
 3 Same } SKIP to 11a
 4 Don't know } SKIP to 11a

b. Were you thinking about any specific kinds of crimes when you said you think crime in the U.S. has (increased/decreased)?
 0 No Yes - What kinds of crimes? _____

350 11a. How safe do you feel or would you feel being out alone in your neighborhood AT NIGHT?
 1 Very safe
 2 Reasonably safe
 3 Somewhat unsafe
 4 Very unsafe

351 b. How about DURING THE DAY - how safe do you feel or would you feel being out alone in your neighborhood?
 1 Very safe
 2 Reasonably safe
 3 Somewhat unsafe
 4 Very unsafe

CHECK ITEM B
 Look at 11a and b. Was box 3 or 4 marked in either item?
 Yes - ASK 11c No - SKIP to 12

352 11c. Is the neighborhood dangerous enough to make you think seriously about moving somewhere else?
 0 No - SKIP to 12
 * Yes - Why don't you? Any other reason? (Mark all that apply)
 1 Can't afford to
 2 Can't find other housing
 3 Relatives, friends nearby
 4 Convenient to work, etc.
 5 Plan to move soon
 6 Health or age
 7 Other - Specify _____

(If more than one reason)

354 d. Which reason would you say is the most important?

 Enter item number _____

355 12. How do you think your neighborhood compares with others in this metropolitan area in terms of crime? Would you say it is -
 1 Much more dangerous?
 2 More dangerous?
 3 About average?
 4 Less dangerous?
 5 Much less dangerous?

356 13a. Are there some parts of this metropolitan area where you have a reason to go or would like to go DURING THE DAY, but are afraid to because of fear of crime?
 0 No Yes - Which section(s)? _____

 ← Number of specific places mentioned

357 b. How about AT NIGHT - are there some parts of this area where you have a reason to go or would like to go but are afraid to because of fear of crime?
 0 No Yes - Which section(s)? _____

 ← Number of specific places mentioned

358 14a. Would you say, in general, that your local police are doing a good job, an average job, or a poor job?
 1 Good
 2 Average
 3 Poor
 4 Don't know - SKIP to 15a

* b. In what ways could they improve? Any other ways? (Mark all that apply)
 1 No improvement needed - SKIP to 15a
 2 Hire more policemen
 3 Concentrate on more important duties, serious crime, etc.
 4 Be more prompt, responsive, alert
 5 Improve training, raise qualifications or pay, recruitment policies
 6 Be more courteous, improve attitude, community relations
 7 Don't discriminate
 8 Need more traffic control
 9 Need more policemen of particular type (foot, car) in certain areas or at certain times
 10 Don't know
 11 Other - Specify _____

(If more than one way)

360 c. Which would you say is the most important?

 Enter item number _____

361 15a. Now I have some more questions about your opinions concerning crime. Please take this card. (Hand respondent Attitude Flashcard, NCS-574) Look at the FIRST set of statements. Which one do you agree with most?
 1 My chances of being attacked or robbed have GONE UP in the past few years
 2 My chances of being attacked or robbed have GONE DOWN in the past few years
 3 My chances of being attacked or robbed haven't changed in the past few years
 4 No opinion

362 b. Which of the SECOND group do you agree with most?
 1 Crime is LESS serious than the newspapers and TV say
 2 Crime is MORE serious than the newspapers and TV say
 3 Crime is about as serious as the newspapers and TV say
 4 No opinion

363 16a. Do you think PEOPLE IN GENERAL have limited or changed their activities in the past few years because they are afraid of crime?
 1 Yes
 2 No

364 b. Do you think that most PEOPLE IN THIS NEIGHBORHOOD have limited or changed their activities in the past few years because they are afraid of crime?
 1 Yes
 2 No

365 c. In general, have YOU limited or changed your activities in the past few years because of crime?
 1 Yes
 2 No

366

367

INTERVIEWER - Continue interview with this respondent on NCS-3

Technical information and reliability of the estimates

Survey results contained in this publication are based on data gathered during early 1974 from persons residing within the city limits of Miami, including those living in certain types of group quarters, such as dormitories, rooming houses, and religious group dwellings. Nonresidents of the city, including tourists and commuters, did not fall within the scope of the survey. Similarly, crewmembers of merchant vessels, Armed Forces personnel living in military barracks, and institutionalized persons, such as correctional facility inmates, were not under consideration. With these exceptions, all persons age 16 and over living in units designated for the sample were eligible to be interviewed.

Each interviewer's first contact with a unit selected for the survey was in person, and, if it were not possible to secure interviews with all eligible members of the household during the initial visit, interviews by telephone were permissible thereafter. Proxy responses were not permitted for the attitude survey. Survey records were processed and weighted, yielding results representative both of the city's population as a whole and of various sectors within the population. Because they are based on a sample survey rather than a complete enumeration, the results are estimates.

Sample design and size

Estimates from the survey are based on data obtained from a stratified sample. The basic frame from which the attitude sample was drawn—the city's complete housing inventory, as determined by the 1970 Census of Population and Housing—was the same as that for the victimization survey. A determination was made that a sample roughly half the size of the victimization sample would yield enough attitudinal data on which to base reliable estimates. For the purpose of selecting the victimization sample, the city's housing units were distributed among 105 strata on the basis of various characteristics. Occupied units, which comprised the majority, were grouped into 100 strata defined by a combination of the following characteristics: type of tenure (owned or rented); number of household members (five categories); household income (five categories); and race of head of household (white or other than white). Housing units vacant at the time of the Census were assigned to an additional four strata, where they were distributed on the basis of rental or property value. A single stratum incorporated group quarters.

To account for units built after the 1970 Census, a sample was drawn, by means of an independent clerical operation, of permits issued for the construction of residential housing within the city. This enabled the proper representation in the survey of persons occupying housing built after 1970.

In order to develop the half sample required for the attitude survey, each unit was randomly assigned to 1 of 12 panels, with units in the first 6 panels being designated for the attitude survey. This procedure resulted in the selection of 6,070 housing units. During the survey period, 1,004 of these units were found to be vacant, demolished, converted to nonresidential use, temporarily occupied by nonresidents, or otherwise ineligible for both the victimization and attitude surveys. At an additional 137 units visited by interviewers it was impossible to conduct interviews because the occupants could not be reached after repeated calls, did not wish to participate in the survey, or were unavailable for other reasons. Therefore, interviews were taken with the occupants of 4,929 housing units, and the rate of participation among units qualified for interviewing was 97.3 percent. Participating units were occupied by a total of 9,909 persons age 16 and over, or an average of two residents of the relevant ages per unit. Interviews were conducted with 9,650 of these persons, resulting in a response rate of 97.4 percent among eligible residents.

Estimation procedure

Data records generated by the attitude survey were assigned either of two sets of final tabulation weights, one for the records of individual respondents and another for those of household respondents. In each case, the final weight was the product of two elements—a factor of roughly twice the weight used in tabulating victimization data estimates and a ratio estimation factor. The following steps determined the tabulation weight for personal victimization data and were, therefore, an integral part of the estimation procedure for attitude data gathered from individual respondents: (1) a basic weight, reflecting the selected unit's probability of being included in the sample; (2) a factor to compensate for the subsampling of units, a situation that arose in instances where the interviewer discovered many more units at the sample address than had been listed in the decennial Census; (3) a within-household noninterview adjustment to account for situations where at least one but not all eligible persons in a household were interviewed; (4) a household non-interview adjustment to account for households qualified in the survey but from which an interview was not obtained; (5) a household ratio estimate factor for

bringing estimates developed from the sample of 1970 housing units into adjustment with the complete Census count of such units; and (6) a population ratio estimate factor that brought the sample estimate into accord with post-Census estimates of the population age 12 and over and adjusted the data for possible biases resulting from undercoverage or overcoverage of the population.

The household ratio estimation procedure (step 5) achieved a slight reduction in the extent of sampling variability, thereby reducing the margin of error in the tabulated survey results. It also compensated for the exclusion from each stratum of any households already included in samples for certain other Census Bureau programs. The household ratio estimator was not applied to interview records gathered from residents of group quarters or of units constructed after the Census. For household victimization data (and attitude data from household respondents), the final weight incorporated all of the steps described above except the third and sixth.

The ratio estimation factor, second element of the final weight, was an adjustment for bringing data from the attitude survey (which, as indicated, was based on a half sample) into accord with data from the victimization survey (based on the whole sample). This adjustment, required because the attitude sample was randomly constructed from the victimization sample, was used for the age, sex, and race characteristics of respondents.

Reliability of estimates

As previously noted, survey results contained in this report are estimates. Despite the precautions taken to minimize sampling variability, the estimates are subject to errors arising from the fact that the sample employed was only one of a large number of possible samples of equal size that could have been used applying the same sample design and selection procedures. Estimates derived from different samples may vary somewhat; they also may differ from figures developed from the average of all possible samples, even if the surveys were administered with the same schedules, instructions, and interviewers.

The standard error of a survey estimate is a measure of the variation among estimates from all possible samples and is, therefore, a gauge of the precision with which the estimate from a particular sample approximates the average result of all possible samples. The estimate and its associated standard error may be used to construct a confidence interval, that is, an interval having a prescribed probability that it would include the average result of all possible samples. The average

value of all possible samples may or may not be contained in any particular computed interval. However, the chances are about 68 out of 100 that a survey-derived estimate would differ from the average result of all possible samples by less than one standard error. Similarly, the chances are about 90 out of 100 that the difference would be less than 1.6 times the standard error; about 95 out of 100 that the difference would be 2.0 times the standard error; and 99 out of 100 chances that it would be less than 2.5 times the standard error. The 68 percent confidence interval is defined as the range of values given by the estimate minus the standard error and the estimate plus the standard error; the chances are 68 in 100 that the average value of all possible samples would fall within that range. Similarly, the 95 percent confidence interval is defined as the estimate plus or minus two standard errors.

In addition to sampling error, the estimates presented in this report are subject to nonsampling error, chiefly affecting the accuracy of the distinction between victims and nonvictims. A major source of nonsampling error is related to the ability of respondents to recall whether or not they were victimized during the 12 months prior to the time of interview. Research on recall indicates that the ability to remember a crime varies with the time interval between victimization and interview, the type of crime, and, perhaps, the socio-demographic characteristics of the respondent. Taken together, recall problems may result in an understatement of the "true" number of victimized persons and households, as defined for the purpose of this report. Another source of nonsampling error pertaining to victimization experience involves telescoping, or bringing within the appropriate 12-month reference period victimizations that occurred before or after the close of the period.

Although the problems of recall and telescoping probably weakened the differentiation between victims and nonvictims, these would *not* have affected the data on personal attitudes or behavior. Nevertheless, such data may have been affected by nonsampling errors resulting from incomplete or erroneous responses, systematic mistakes introduced by interviewers, and improper coding and processing of data. Many of these errors also would occur in a complete census. Quality control measures, such as interviewer observation and a reinterview program, as well as edit procedures in the field and at the clerical and computer processing stages, were utilized to keep such errors at an acceptably low level. As calculated for this survey, the standard errors partially measure only those random nonsampling errors arising from response and interviewer errors; they do not, however, take into account any systematic biases in the data.

Regarding the reliability of data, it should be noted that estimates based on zero or on about 10 or fewer sample cases have been considered unreliable. Such estimates are identified in footnotes to the data tables and were not used for purposes of analysis in this report. For Miami, a minimum weighted estimate of 300 was considered statistically reliable, as was any percentage based on such a figure.

Computation and application of the standard error

For survey estimates relevant to either the individual or household respondents, standard errors displayed on tables at the end of this appendix can be used for gauging sampling variability. These errors are approximations and suggest an order of magnitude of the standard error rather than the precise error associated with any given estimate. Table I contains standard error approximations applicable to information from individual respondents and Table II gives errors for data derived from household respondents. For percentages not specifically listed in the tables, linear interpolation must be used to approximate the standard error.

To illustrate the application of standard errors in measuring sampling variability, Data Table I in this report shows that 69.7 percent of all Miami residents age 16 and over (282,800 persons) believed crime in the United States had increased. Two-way linear interpolation of data listed in Table I would yield a standard error of about 0.5 percent. Consequently, chances are 68 out of 100 that the estimated percentage of 69.7 would be within 0.5 percentage points of the average result from all possible samples; i.e., the 68 percent confidence interval associated with the estimate would be from 69.2 to 70.2. Furthermore, the chances are 95 out of 100 that the estimated percentage would be roughly within one percentage point of the average for all samples; i.e., the 95 percent confidence interval would be about 68.7 to 70.7 percent. Standard errors associated with data from household respondents are calculated in the same manner, using Table II.

In comparing two sample estimates, the standard error of the difference between the two figures is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately. As an example, Data Table 12 shows that 31.2 percent of males and 15.6 percent of females felt very safe when out alone in the neighborhood at night, a difference of 15.6 percentage points. The standard error for each estimate, determined by interpolation, was about 0.9 (males) and 0.6 (females).

Using the formula described previously, the standard error of the difference between 31.2 and 15.6 percent is expressed as $\sqrt{(0.9)^2 + (0.6)^2}$, which equals approximately 1.1. Thus, the confidence interval at one standard error around the difference of 15.6 would be from 14.5 to 16.7 (15.6 plus or minus 1.1) and at two standard errors from 13.4 to 17.8. The ratio of a difference to its standard error defines a value that can be equated to a level of significance. For example, a ratio of about 2.0 (or more) denotes that the difference is significant at the 95 percent confidence level (or higher); a ratio ranging between about 1.6 and 2.0 indicates that the difference is significant at a confidence level between 90 and 95 percent; and a ratio of less than about 1.6 defines a level of confidence below 90 percent. In the above example, the ratio of the difference (15.6) to the standard error (1.1) is equal to 14.2, a figure well above the 2.0 minimum level of confidence applied in this report. Thus, it was concluded that the difference between the two proportions was statistically significant. For data gathered from household respondents, the significance of differences between two sample estimates is tested by the same procedure, using standard errors in Table II.

Table I. Individual respondent data: Standard error approximations for estimated percentages

(68 chances out of 100)

Base of percent	Estimated percent of answers by individual respondents					
	1.0 or 99.0	2.5 or 97.5	5.0 or 95.0	10.0 or 90.0	25.0 or 75.0	50.0
100	6.4	10.0	14.0	19.2	27.8	32.1
250	4.0	6.3	8.8	12.2	17.6	20.3
500	2.9	4.5	6.3	8.6	12.4	14.3
1,000	2.0	3.2	4.4	6.1	8.8	10.1
2,500	1.3	2.0	2.8	3.8	5.6	6.4
5,000	0.9	1.4	2.0	2.7	3.9	4.5
10,000	0.6	1.0	1.4	1.9	2.8	3.2
25,000	0.4	0.6	0.9	1.2	1.8	2.0
50,000	0.3	0.4	0.6	0.9	1.2	1.4
100,000	0.2	0.3	0.4	0.6	0.9	1.0
250,000	0.1	0.2	0.3	0.4	0.5	0.6
500,000	0.1	0.1	0.2	0.3	0.4	0.5

NOTE: The standard errors in this table are applicable to information in Data Tables 1-18 and 27-37.

Table II. Household respondent data: Standard error approximations for estimated percentages

(68 chances out of 100)

Base of percent	Estimated percent of answers by household respondents					
	1.0 or 99.0	2.5 or 97.5	5.0 or 95.0	10.0 or 90.0	25.0 or 75.0	50.0
100	5.0	7.8	10.9	15.0	21.6	24.9
250	3.1	4.9	6.9	9.5	13.7	15.8
500	2.2	3.5	4.9	6.7	9.7	11.2
1,000	1.6	2.5	3.4	4.7	6.8	7.9
2,500	1.0	1.6	2.2	3.0	4.3	5.0
5,000	0.7	1.1	1.5	2.1	3.1	3.5
10,000	0.5	0.8	1.1	1.5	2.2	2.5
25,000	0.3	0.5	0.7	0.9	1.4	1.6
50,000	0.2	0.3	0.5	0.7	1.0	1.1
100,000	0.2	0.2	0.3	0.5	0.7	0.8
250,000	0.1	0.2	0.2	0.3	0.4	0.5

NOTE: The standard errors in this table are applicable to information in Data Tables 19-26.

Glossary

Age—The appropriate age category is determined by each respondent's age as of the last day of the month preceding the interview.

Annual family income—Includes the income of the household head and all other related persons residing in the same household unit. Covers the 12 months preceding the interview and includes wages, salaries, net income from business or farm, pensions, interest, dividends, rent, and any other form of monetary income. The income of persons unrelated to the head of the household is excluded.

Assault—An unlawful physical attack, whether aggravated or simple, upon a person. Includes attempted assault with or without a weapon. Excludes rape and attempted rape, as well as attacks involving theft or attempted theft, which are classified as robbery.

Burglary—Unlawful or forcible entry of a residence, usually, but not necessarily, attended by theft. Includes attempted forcible entry.

Central city—The largest city of a standard metropolitan statistical area (SMSA).

Community relations—Refers to question 14b (ways of improving police performance) and includes two response categories: "Be more courteous, improve attitude, community relations" and "Don't discriminate."

Downtown shopping area—The central shopping district of the city where the respondent lives.

Evening entertainment—Refers to entertainment available in public places, such as restaurants, theaters, bowling alleys, nightclubs, bars, ice cream parlors, etc. Excludes club meetings, shopping, and social visits to the homes of relatives or acquaintances.

General merchandise shopping—Refers to shopping for goods other than food, such as clothing, furniture, housewares, etc.

Head of household—For classification purposes, only one individual per household can be the head person. In husband-wife households, the husband arbitrarily is considered to be the head. In other households, the head person is the individual so regarded by its members; generally, that person is the chief breadwinner.

Household—Consists of the occupants of separate living quarters meeting either of the following criteria: (1) Persons, whether present or temporarily absent, whose usual place of residence is the housing unit in question, or (2) Persons staying in the housing unit who have no usual place of residence elsewhere.

Household attitude questions—Items 1 through 7 of Form NCS 6. For households that consist of more than one member, the questions apply to the entire household.

Household larceny—Theft or attempted theft of property or cash from a residence or its immediate vicinity. Forcible entry, attempted forcible entry, or unlawful entry are not involved.

Household respondent—A knowledgeable adult member of the household, most frequently the head of household or that person's spouse. For each household, such a person answers the "household attitude questions."

Individual attitude questions—Items 8 through 16 of Form NCS 6. The questions apply to each person, not the entire household.

Individual respondent—Each person, age 16 and over, including the household respondent, who participates in the survey. All such persons answer the "individual questions."

Local police—The police force in the city where the respondent lives at the time of the interview.

Major food shopping—Refers to shopping for the bulk of the household groceries.

Measured crimes—For the purpose of this report, the offenses are rape, personal robbery, assault, personal larceny, burglary, household larceny, and motor vehicle theft, as determined by the victimization component of the survey. Includes both completed and attempted acts that occurred during the 12 months prior to the month of interview.

Motor vehicle theft—Stealing or unauthorized taking of a motor vehicle, including attempts at such acts. Motor vehicles include automobiles, trucks, motorcycles, and any other motorized vehicles legally allowed on public roads and highways.

Neighborhood—The general vicinity of the respondent's dwelling. The boundaries of a neighborhood define an area with which the respondent identifies.

Nonvictim—See "Not victimized," below.

Not victimized—For the purpose of this report, persons not categorized as "victimized" (see below) are considered "not victimized."

Offender—The perpetrator of a crime.

Operational practices—Refers to question 14b (ways of improving police performance) and includes four response categories: "Concentrate on more important duties, serious crime, etc."; "Be more prompt, responsive, alert"; "Need more traffic control"; and "Need more policemen of particular type (foot, car) in certain areas or at certain times."

Personal larceny—Theft or attempted theft of property or cash, either with contact (but without force or threat of force) or without direct contact between victim and offender.

Personnel resources—Refers to question 14b (ways of improving police performance) and includes two response categories: "Hire more policemen" and "Improve training, raise qualifications or pay, recruitment policies."

Race—Determined by the interviewer upon observation, and asked only about persons not related to the head of household who were not present at the time of interview. The racial categories distinguished are white, black, and other. The category "other" consists mainly of American Indians and/or persons of Asian ancestry.

Rape—Carnal knowledge through the use of force or the threat of force, including attempts. Statutory rape (without force) is excluded. Includes both heterosexual and homosexual rape.

Rate of victimization—See "Victimization rate," below.

Robbery—Theft or attempted theft, directly from a person, of property or cash by force or threat of force, with or without a weapon.

Series victimizations—Three or more criminal events similar, if not identical, in nature and incurred by a person unable to identify separately the details of each act, or, in some cases, to recount accurately the total number of such acts. The term is applicable to each of the crimes measured by the victimization component of the survey.

Suburban or neighborhood shopping areas—Shopping centers of districts either outside the city limits or in outlying areas of the city near the respondent's residence.

Victim—See "Victimized," below.

Victimization—A specific criminal act as it affects a single victim, whether a person or household. In criminal acts against persons, the number of victimizations is determined by the number of victims of such acts. Each criminal act against a household is assumed to involve a single victim, the affected household.

Victimization rate—For crimes against persons, the victimization rate, a measure of occurrence among population groups at risk, is computed on the basis of the number of victimizations per 1,000 resident population age 12 and over. For crimes against households, victimization rates are calculated on the basis of the number of victimizations per 1,000 households.

Victimized—For the purpose of this report, persons are regarded as "victimized" if they meet either of two criteria. (1) They personally experienced one or more of the following criminal victimizations during the 12 months prior to the month of interview: rape, personal robbery, assault, or personal larceny. Or, (2) they are members of a household that experienced one or more of the following criminal victimizations during the same time frame: burglary, household larceny, or motor vehicle theft.

USER EVALUATION QUESTIONNAIRE

Miami: Public Attitudes About Crime
NCJ-46239, SD-NCS-C-24

Dear Reader:

The Law Enforcement Assistance Administration is interested in your comments and suggestions about this report. We have provided this form for whatever opinions you wish to express about it. Please cut out both of these pages, staple them together on one corner, and fold so that the Law Enforcement Assistance Administration address appears on the outside. After folding, use tape to seal closed. No postage stamp is necessary.

Thank you for your help.

1. For what purpose did you use this report?

2. For that purpose, the report— Met most of my needs Met some of my needs Met none of my needs

3. How will this report be useful to you?

Data source

Other (please specify) _____

Teaching material

Reference for article or report

Will not be useful to me (please explain) _____

General information

Criminal justice program planning

4. Which parts of the report, if any, were difficult to understand or use? How could they be improved?

5. Can you point out specific parts of the text or table notes that are not clear or terms that need to be defined?

6. Are there ways this report could be improved that you have not mentioned?

7. Please suggest other topics you would like to see addressed in future analytic reports using National Crime Survey victimization and/or attitude data.

8. In what capacity did you use this report?

- Researcher
- Educator
- Student
- Criminal justice agency employee
- Government other than criminal justice - Specify _____
- Other - Specify _____
