To aid in the assignment of a level of supervision, a method of assessing a client's propensity for further criminal behavior was developed. In addition to felony and misdemeanor convictions, the concept of criminal behavior was expanded to include abscondions, rules violations and arrests. Each of these factors was then assigned a weight as illustrated in the following table:

<table>
<thead>
<tr>
<th>FACTOR</th>
<th>WEIGHT PER OCCURRENCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rules Violations</td>
<td>1</td>
</tr>
<tr>
<td>Arrests</td>
<td>1</td>
</tr>
<tr>
<td>Misdemeanor Convictions</td>
<td>3</td>
</tr>
<tr>
<td>Abscondions</td>
<td>5</td>
</tr>
<tr>
<td>Felony Convictions</td>
<td>7</td>
</tr>
<tr>
<td>Convictions for Assaultive Offenses</td>
<td>9</td>
</tr>
</tbody>
</table>

Each weighted occurrence was then added to a base score of 1. Scores were cut off at 30 in order to prevent a few very high totals from skewing the data.

Information was collected on approximately 250 randomly selected closed or revoked cases. The data analyzed were, to a large extent, determined by a committee of agents, supervisors, and project staff that was responsible for developing differential supervision levels and criteria for assignment to each level. The collective experience and expertise of that group suggested that "risk" could best be determined through the analysis of the following items:

1. Age at intake
2. Number of prior felony convictions
3. Number of prior misdemeanor convictions
4. Number of prior incarcerations - both adult and juvenile
5. Number of prior periods of probation/parole supervision
6. Number of prior revocations
7. Age at earliest arrest
8. Age at earliest conviction
To select the items which would cumulatively provide the best scale for assessing client risk, a multiple linear regression analysis was implemented. Variables were entered in a stepwise fashion.* The standard error of the estimate was minimized after seven variables were entered. The following table outlines the results:

<table>
<thead>
<tr>
<th>VARIABLE</th>
<th>MULTIPLE R</th>
<th>R²</th>
<th>SIMPLE R</th>
<th>F RATIO</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attitude</td>
<td>.6003</td>
<td>.36</td>
<td>.600</td>
<td></td>
</tr>
<tr>
<td>Age at First Conviction</td>
<td>.7087</td>
<td>.50</td>
<td>.354</td>
<td></td>
</tr>
<tr>
<td>Prior Revocations</td>
<td>.7268</td>
<td>.53</td>
<td>.350</td>
<td></td>
</tr>
<tr>
<td>Alcohol Usage/Problems</td>
<td>.7412</td>
<td>.54</td>
<td>.421</td>
<td></td>
</tr>
<tr>
<td>No. of Address Changes</td>
<td>.7513</td>
<td>.56</td>
<td>.351</td>
<td></td>
</tr>
<tr>
<td>Felony Convictions</td>
<td>.7591</td>
<td>.58</td>
<td>.335</td>
<td></td>
</tr>
<tr>
<td>Prior Periods of Probation/Parole</td>
<td>.7613</td>
<td>.58</td>
<td>.412</td>
<td>34.16*</td>
</tr>
</tbody>
</table>

*Significant at the .01 level

*Two items which proved to be good predictors, Response to Court or Bureau-imposed Conditions and Use of Community Resources, were not entered because they are difficult criteria to assess at intake. (Classification should be completed within 30 days of reception.)
Although the factors analyzed explained only 58% of the variance in criminal behavior, the results proved sufficient to classify clients in less precise rankings. (The analysis could be used to predict low, medium and high degrees of criminal behavior rather than actual scores. "Low" criminal behavior meant a score of two or less on the criminal behavior scale. "High" criminal behavior was defined as a revocation or conviction for a new felony offense during the period of supervision.) Utilizing these rankings and comparing them to predicted scores indicated that, overall, 72% of the cases were "placed" correctly using the resultant regression equation. The following table outlines the percentages correctly placed within each group:

<table>
<thead>
<tr>
<th>AMOUNT OF CRIMINAL BEHAVIOR PREDICTED</th>
<th>ACTUAL AMOUNT OF CRIMINAL BEHAVIOR REPORTED</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Low  Moderate High</td>
</tr>
<tr>
<td>Low (Low Supervision)</td>
<td>89%  9%  2%</td>
</tr>
<tr>
<td>Moderate (Medium Supervision)</td>
<td>21%  29%  50%</td>
</tr>
<tr>
<td>High (Maximum Supervision)</td>
<td>8%   25%  67%</td>
</tr>
</tbody>
</table>

Of the high risk clients misclassified as moderate risks, 3/4 had scores in the upper third of the moderate range. The substantial crossover between the high and medium risk classification scores indicates that this type of client will be difficult to classify.

In an attempt to achieve better results, group means or percentages (depending upon the factor analyzed) were compared for all variables. Based on significant differences and simple correlation coefficients three items were added to the risk scale. They were:

1. Specific offenses (Burglary, Robbery, Auto Theft, Forgery, Worthless Checks, and Theft)
2. Percentage of time employed
3. Drug Usage/Problems

All ten variables comprising the final scale were then assigned weights based on their correlation with criminal behavior. (See Addendum 1) The scale was then tested utilizing the random sample of closed and revoked cases. While the percentage of correct predictions actually declined slightly, it was felt that this may be due primarily to the fact that the weight associated with each independent variable was rounded to a whole number somewhat "blunting" the accuracy of the regression equation.
The following table outlines the results:

<table>
<thead>
<tr>
<th>AMOUNT OF CRIMINAL BEHAVIOR PREDICTED</th>
<th>ACTUAL AMOUNT OF CRIMINAL BEHAVIOR REPORTED</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low (Low Supervision)</td>
<td>Low 10% Moderate 41% High 66%</td>
</tr>
<tr>
<td>Moderate (Medium Supervision)</td>
<td>32% 27% 41%</td>
</tr>
<tr>
<td>High (Maximum Supervision)</td>
<td>10% 24% 66%</td>
</tr>
</tbody>
</table>

CUT-OFF SCORES FOR EACH CLASSIFICATION:

The cut-off scores for each level of supervision were set somewhat low for two reasons. First, an important factor, the actual quality and quantity of supervision given each client, could not be included in the analysis. If a basic assumption of probation and parole (supervision will diminish criminal behavior) is at all valid, then successful completion of probation or parole should be strongly influenced by the degree and type of supervision. The regression analysis left 42% of the variance in criminal behavior unexplained indicating that agent intervention may be a significant factor in decreasing criminal behavior. Secondly, predictive devices will misclassify some persons. This is regarded as "error" and its probable limits can be stated. However, the "error" term can be manipulated - and with a predictive scale that will result in an assignment of Corrections' clients to a structured supervision level - such manipulation seems essential. It was assumed that in a test situation it would be better to over supervise than to under supervise. Hence, the cut-off scores for each level of supervision were lowered so that nearly all of the "error" occurred with clients being assigned to a higher level of supervision than strict interpretation of an individual score would indicate.

The low cut-off scores resulted in only 5% of the entire sample analyzed being classified lower than their actual probation/parole outcomes warranted. Initial indications are that approximately 50% of all new clients will be scaled as high risk clients.*

*This is based solely on a sample from Dane County and may be somewhat high. Agents have expressed the opinion that Dane County judges make more use of probation than do judges in other counties.
REEVALUATION:

Client risk will be reevaluated every six months using a scale different than that used at intake. (See Addendum 2) The weights assigned to some items have been changed reflecting a decreased emphasis on prior record. Other items have been replaced by better indicators of client risk which agents can readily assess following six months of supervision. In general, factors related to recent behavior increase in importance and factors related to the client's prior record decrease in importance; hence, the client's response to supervision, to a large extent, determines the level of supervision assigned. However, the client's prior record still accounts for 33% of the total points on the reevaluation scale.

Preliminary indications are that the number of clients initially rated as high risks will decline by 40%-50% at the first reevaluation. This corresponds well with research that indicates that the first six months of supervision are critical. If reevaluation continues to show a decrease in high risk ratings, this will effect a system in which a high percentage of clients will be under maximum supervision for the first six months of probation/parole and that percentage will decrease rapidly as time under supervision increases. The Project's first experience with reevaluation also indicates that while the number of clients rated as medium risks increases at the six month reevaluation, the number of clients rated as low risks remains about the same.

Approximately one-third of the average caseload has been under supervision for less than six months. The following table outlines the effects of the high percentage of clients initially assigned to maximum supervision on a caseload of 60 clients.

<table>
<thead>
<tr>
<th></th>
<th>Clients on Probation Less Than Six Months</th>
<th>Clients on Probation Six Months or More</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td># of Clients</td>
<td>20</td>
<td>40</td>
<td>60</td>
</tr>
<tr>
<td># Classified as Maximum</td>
<td>10 (50%)</td>
<td>10 (25%)</td>
<td>20 (33%)*</td>
</tr>
</tbody>
</table>

*If the number of clients rates as maximum risks continues to decline at 12, 18 and 24 months under supervision then less than 33% of an average caseload will be rated maximum risks.
ASSESSMENT OF CLIENT RISK

Client Name: ___________________________ Last Name: ___________________________ First Name: ___________________________ Client Number: ___________________________

Probation Control Date or Institution Release Date: ___________________________ Month, Day, Year

Agent Last Name: ___________________________ Number: ___________________________

Select the appropriate answer and enter the associated weight in the score column. Total all scores to arrive at the risk assessment score.

Number of Address Changes in Last 12 Months: ___________________________

0 None
1 One
2 Two or more

Percentage of Time Employed in Last 12 Months: ___________________________

0 60% or more
1 40% - 59%
2 Under 40%
3 Not applicable

Alcohol Usage/Problems: ___________________________

0 No apparent problems
1 Moderate problems
2 Serious problems

Other Drug Usage/Problems: ___________________________

0 No apparent problems
1 Moderate problems
2 Serious problems

Attitude: ___________________________

0 Motivated to change; receptive to assistance
1 Dependent or unwilling to accept responsibility
2 Rationalizes behavior, negative, not motivated to change

Age at First Conviction: ___________________________

0 24 or older
1 20 - 23
2 19 or younger

Number of Prior Periods of Probation/Parole Supervision: ___________________________

0 None
1 One or more

Number of Prior Probation/Parole Revocations: ___________________________

0 None
1 One or more

Number of Prior Felony Convictions: ___________________________

0 None
1 One
2 Two or more

Convictions or Juvenile Adjudications for: ___________________________

(Select all applicable and add for score)

2 Burglary
2 Theft
2 Auto theft
2 Robbery
3 Worthless checks
3 Forgery

Conviction or Juvenile Adjudication for Assisive Offense: ___________________________

(An offense which involves the use of a weapon, physical force or the threat of force)

0 Yes
1 No

TOTAL SCORE: ___________________________
## REASSESSMENT OF CLIENT RISK

<table>
<thead>
<tr>
<th><strong>Client Name</strong></th>
<th><strong>Last</strong></th>

<th><strong>MI</strong></th>
<th><strong>Client Number</strong></th>
<th><strong>Date of Reevaluation</strong></th>
<th><strong>Month, Day, Year</strong></th>
<th><strong>Agent Last Name</strong></th>
<th><strong>Number</strong></th>
</tr>
</thead>
</table>

Select the appropriate answer and enter the associated weight in the score column. Total all scores to arrive at the risk reassessment score.

### Number of Address Changes in Last 12 Months:
- 0 None
- 2 One
- 3 Two or more

### Age at First Conviction:
- 0 24 or older
- 1 20 - 23
- 2 19 or younger

### Number of Probation/Parole Revocations:
- 0 None
- 2 One or more

### Number of Prior Felony Convictions:
- 0 None
- 1 One
- 3 Two or more

### Convictions or Juvenile Adjudications for:
- 1 Burglary
- 1 Theft
- 1 Auto theft
- 1 Robbery
- 2 Worthless checks
- 2 Forgery

### Rate the Following Based on Period of Supervision Only:

#### Percentage of Time Employed While Under Supervision:
- 0 66% or more
- 1 40% - 65%
- 2 Under 40%
- 3 Not applicable

#### Alcohol Usage/Problems:
- 0 No apparent problem
- 2 Moderate problem
- 5 Serious problems

#### Other Drug Usage/Problems:
- 0 No apparent problem
- 1 Moderate problem
- 3 Serious problems

#### Problems in Inter-Personal Relationships:
- 0 None
- 1 Few
- 3 Moderate
- 5 Severe

#### Social Identification:
- 0 Mainly with positive individuals
- 1 Mainly with delinquent individuals

#### Response to Court or Bureau-Imposed Conditions:
- 0 No problems of consequence
- 3 Moderate compliance problems
- 5 Has been unwilling to comply

#### Use of Community Resources:
- 0 Not needed
- 2 Needed but not available
- 3 Utilized but not beneficial
- 4 Available but rejected
