REPORT OF THE CHARACTERISTICS OF CHILDREN COMMITTED TO STATE CARE IN FISCAL YEAR 1979

This report represents the data recorded on the Direct Care System's Intake, History, Clinical Assessment, and Educational Assessment forms submitted by the Court Service Units, the Reception and Diagnostic Center, the Mobile Psychiatric Clinic and the Rehabilitative School Authority during fiscal year 1979. All of the children committed to the care of the Virginia Department of Corrections are received and tested at the Reception and Diagnostic Center. There were 1,306 children committed in the fiscal year ending June 30, 1979. This report is the second Characteristics Report published on a fiscal year basis; in prior years the statistics have been reported on a calendar year basis.

Summary of General Characteristics

COMMITTING OFFENSE

Of the 1,306 children committed in fiscal year 1979, 676 or 62.8 percent were committed for Offenses Against Property, while only 151 or 14.0 percent were committed for Offenses Against Persons. The most frequent committing offense was Break and Enter, accounting for 224 or 33.1 percent of all Offenses Against Property. Assault and Battery was the most common Offense Against Persons, accounting for 81 or 53.6 percent of such offenses. Alcohol or drug-related offenses accounted for only 17 or 1.3 percent of all commitments. The most common drug-related offense was Possession of Narcotics (Misdemeanor), accounting for 8 or 47.1 percent of all alcohol or drug-related offenses. There were 190 (14.5 percent) children committed for violation of probation.

RACE AND SEX

Only 188 or 14.4 percent of all commitments to the Department of Corrections in fiscal 1979 were female, while 1,118 or 85.6 percent were male. Black children committed totaled 520 or 39.8 percent, while white children totaled 786 or 60.2 percent. Black female commitments comprised only 60 or 4.6 percent of all commitments, while white females accounted for 128 or 9.8 percent of the total. Black males accounted for 460 commitments or 35.2 percent, while white males comprised the largest number of commitments with 658 or 50.4 percent.

AGE AT COMMITMENT

The average age of all children committed was 15.4 years. The most frequent age at commitment was 16 years, while 15 years was the second most frequent age.

AGE AT FIRST COMMUNITY CONTACT AND TYPE OF CONTACT

The most frequent age at first community contact was 13 years, comprising 18.4 percent of all commitments. Children who were 14 years old accounted for the second most frequent age with 17.8 percent. The Juvenile Court was the most frequent type of first contact, accounting for 816 or 79.6 percent of all commitments. The school psychologist/social worker was a very distant second in type of first contact with 105 or 10.2 percent of all commitments.

INTELLIGENCE

Average or Normal intelligence was the mode for all children committed in fiscal 1979, accounting for 50.3 percent of all commitments. Children with Dull Normal or below intelligence accounted for 33.3 percent of all commitments, while Bright Normal and above intelligence accounted for 10.5 percent. There were no children with Very Superior intelligence (I.Q. over 130) and 57 children (5.9 percent) were committed who tested Retarded intelligence (I.Q. below 70).

NUMBER OF COMMITMENTS

Children who were received only once at the Reception and Diagnostic Center accounted for 1,090 or 83.4 percent of the total commitments during fiscal year 1979. More than one commitment does not necessarily indicate recidivism. It is a common practice of the courts to send children to the Reception and Diagnostic Center for pre-dispositional evaluations. If the child is subsequently committed to State care, he will again be received at the Diagnostic Center, accounting for two commitments. Of the 1,306 commitments, 216 or 16.6 percent of the children had been received two or more times at the Center.

COMMITTING COURT

The cities committed the greatest number of children in fiscal 1979, accounting for 722 or 55.0 percent, while the counties committed 584 or 45.0 percent. The City of Norfolk committed the most children with 93, while the City of Newport News was second in commitments with 84. The City of Richmond was third with 83 commitments. The counties of Prince William, Fairfax and Henrico committed the largest number of children for county courts, committing 63, 62 and 47 respectively.

MONTH OF COMMITMENT

The months of January and March had the largest number of commitments, accounting for 135 and 118, respectively. The months of September and December had the fewest commitments with 93 each.

LIVING SITUATION OF CHILD AT TIME OF COMMITMENT

The largest number of children committed, 489 or 45.6 percent, were living with one parent and a step-parent at the time of commitment. Children living with both natural parents accounted for 285 or 26.6 percent of all commitments. Among the total children committed, there were 72.2 percent who had homes with at least two adults in supervision.

EARLIER LIVING SITUATION OF CHILD COMMITTED

The earlier living situation which was most prevalent was with both natural parents (488 or 60.0 percent). The second most prevalent situation was living with one parent and a step-parent (181 or 22.3 percent).

Medical Evaluation

PREVIOUS NEUROLOGICAL EVALUATION

A large majority, 92.1 percent, of the children committed did not have previous neurological evaluations. Only 85 or 7.9 percent had previously had evaluations of this type.

PREVIOUS PSYCHOLOGICAL EVALUATION

Sixty percent of the children committed had at least one previous psychological contact, while 32.0 percent had no previous psychological evaluations.

PREVIOUS PSYCHIATRIC EVALUATION AND HOSPITALIZATION

Of the commitments, 73.6 percent had no previous history of psychiatric evaluations, while 26.4 percent had previous psychiatric evaluations. Most of the children committed had never been hospitalized for psychiatric care. Only 11.7 percent of all children committed had a history of psychiatric hospitalization.

PREVIOUS RESIDENTIAL PLACEMENT FOR BEHAVIOR PROBLEMS

Of the children committed, 30.5 percent had a history of previous residential placement for behavior problems. Previous residential care does not include placement in locally operated community youth homes.

HEIGHT AND WEIGHT

Only 3.9 percent of the children committed were overweight, while only 5.3 percent were underweight. In comparing height, only 2.3 percent of all children committed were tall for their age, while 5.9 percent were short for their age.

VISION, DENTAL AND OTHER MEDICAL DISORDERS

Children with vision disorders comprised 13.1 percent of the commitments, while children with dental disorders represented only 2.3 percent of the total commitments. Children with other medical disorders accounted for 14.5 percent of all commitments.

HEARING AND SPEECH DISORDERS

Only 5.8 percent of the children committed had any hearing disorders. Of all children committed in fiscal 1979, 17.8 percent had speech disorders.

Educational Evaluation

MATHEMATICS

Numeration, addition, subtraction, multiplication, division, fractions, application, money, time and measurement are tests taken from the Individual Mathematics System (IMS). Results from the above tests are used to place children in the appropriate mathematics level in the learning centers. The results from the tests are reported in levels from lowest to highest and do not reflect grade level. The average level for each category was as follows: Numeration-4.2; addition-6.2; subtraction-5.2; multiplication-6.0; division-4.4; fractions-4.2; application-3.8; money-5.2; time-5.0 and measurement-3.8.

• SPECIAL NOTE •

The percentages in the preceding narrative and in the following tables have been adjusted to exclude data not reported. The percentages are based on the adjusted total, which is the total minus the number of those "Not Reported".

The tables represent statistics for Fiscal Year 1979 (July 1, 1978 through June 30, 1979).
