NOTE TO THE READER

The Department of Law Enforcement, which collects the Illinois Uniform Crime Reports Data analyzed in this publication, updates these data as additional information becomes available. As a result of these adjustments, the offense figures presented in this report may not exactly coincide with those found in other publications.

ACKNOWLEDGEMENTS

We would like to thank several people for their assistance and cooperation in the preparation of this report. In particular, Ray Floyd, IUCR Supervisor, Illinois Department of Law Enforcement, and Crystal Hudson, Information Services Specialist, U.S. Bureau of the Census, were especially helpful. SAC and CJIS staff members Jim Lucas, J. David Coldren, Paul Fields, Shelley Mueller, Doug Hudson, Eric Newcomer, Laura Littell, and Stephen Garry donated time to the project as well.

We also greatly appreciate the assistance of the rest of the SAC and CJIS Executive staff, who read and commented on the drafts, and Gussie Bailey and Olga McNamara, who helped enormously with the typing and distribution.

EXECUTIVE SUMMARY

This report describes the pattern of crime from 1972 through 1981 in Illinois and in each of five urban-rural groups of counties.

It contains a general description of the patterns of change over time in each Index crime, and in deceptive practices, forgery and vandalism. It does not attempt to explain the patterns, but only to describe them.

The source of all of the offense data in this report is the Statistical Analysis Center edition of the Illinois Uniform Crime Reports offense data. Police departments and sheriff's offices report the number of offenses known to have been committed in their jurisdictions monthly to the Illinois Department of Law Enforcement (IDLE). SAC receives a copy of the I-UCR data by computer tape annually from IDLE.

The major conclusions of this report may be summarized as follows:

- In 1972, most Index crime rates in Illinois were higher than in the nation as a whole. By 1980, the opposite was true. Most Illinois Index crime rates were lower.

- In Illinois as a whole, Index violent crime rates declined 14 percent between 1972 and 1981. Cook County accounted for most of this decline. In the same time period, Index property crime rates increased 34 percent.

- Between 1972 and 1981, crime rates for murder, rape, burglary, larceny, and motor vehicle theft all increased, while robbery decreased by 23 percent, and aggravated assault decreased by 10.

- Index property offenses out-number violent crimes by more than ten to one in Illinois. In 1981, there was approximately one Index property offense for every 23 state residents, and approximately one Index violent crime for every 227 residents.

- In general, the more urban the county, the higher the crime rate. However, several rural and suburban counties had high crime rates in 1981, and Cook County, the most populous Illinois county, ranked only fourth in violent and thirteenth in property rates of all the counties in the state.

- Over the ten years studied, the greatest percent increase in violent, property, and vandalism crime rates occurred in predominately rural counties that have a city over 25,000.

- Robbery tends to be an urban crime. Cook County typically had one and a half times as many robberies as aggravated assaults, while rural counties had four times as many aggravated assaults as robberies.

• Except for murder, most Index crimes vary according to the season of the year, but some more than others. In particular, aggravated assault and larceny-theft are highly seasonal crimes, with many more known to the police in the summer months than during other times of the year.

• In Cook County, the number of burglary and larceny-theft offenses generally decreased between 1975 and 1981. In the rest of Illinois, these two crimes generally increased.

• While motor vehicle theft offenses statewide remained about the same, the number almost doubled in the rural counties between 1972 and 1978.

• The number of reported deceptive practice offenses in Illinois (excluding Chicago) more than doubled between 1972 and 1981.

• The vandalism offense rate doubled in Illinois outside of Chicago between 1972 and 1981, but the greatest increases occurred outside of metropolitan areas. In the rural counties, vandalism more than tripled.

The appendix contains the 1972 and 1981 Index violent and property crime rates for each Illinois county, and their rank order from lowest to highest (see pages 78-81).

INTRODUCTION

This report describes Illinois crime trends from 1972 through 1981. It will tell you the pattern of change over time in the number of offenses known to the police--which crimes, in which areas of the state, decreased, increased or stayed at the same level over the ten year period. Although it does not explain the reasons for these patterns of change, it provides the descriptive foundation necessary to explanations and forecasts.

The report describes the overall pattern of change in the number of crimes known to the police in Illinois. It describes the patterns over time of eleven crimes--murder, forcible rape, robbery, aggravated assault, burglary, larceny-theft, motor vehicle theft, and arson (the eight Index crimes), and deceptive practices, forgery, and vandalism (three non-Index crimes).¹ The report thus describes trends in some of the most serious crimes and in three other crimes that have been cause for recent public concern.

The Illinois Farmer's Union, the Illinois Agricultural Association, the Illinois Attorney General's Office, and rural law enforcement personnel have recently expressed some concern about the increasing number of deceptive practice and forgery offenses in rural Illinois.² There has also been a recent concern about vandalism. Although not a serious crime, vandalism can generate fear of crime in a community.³ It has also been found to be one of the most prevalent, but the least reported, crimes in rural areas.⁴ Because of these concerns, we have included descriptions of the patterns over time of these three crimes in this report.

The Crime Index is a count of the number of certain offenses known to the police, compiled by the Federal Bureau of Investigation's Uniform Crime Reporting program from information sent to it by state and local jurisdictions, including the

¹For definitions of each of these crimes, see the appendix. There is an exact correspondence between the definitions of the Illinois and federal Index crimes. For more detail, see the SAC publication, How to Trace Crimes through the Illinois Criminal Justice System. For definitions, see the Dictionary of Criminal Justice Data Terminology, published by the U. S. Department of Justice, and Crime in Illinois, published by the Illinois Department of Law Enforcement.

²See the SAC publication, Focus: Crime in Rural Illinois.

³See Coping with Crime (Skogan and Maxfield, 1981) for a discussion of the relationship between vandalism and the fear of crime in an urban setting.

⁴See Donnermeyer (1981) and Phillips (1975) for discussions of vandalism in rural areas.

Illinois Department of Law Enforcement.⁵ Crimes known to the police are offenses that were reported or otherwise came to police attention, occurred within their jurisdiction, and were found to have actually occurred (were not considered to be false complaints.)

Illinois police jurisdictions have reported Index crime offenses to the Illinois Department of Law Enforcement, either directly or through a county sheriff's office, since 1970. The current Uniform Crime Reporting program in Illinois began in 1972. Arson became an Index crime only recently, and Index data are available beginning in 1980. Although arson offense data are available prior to 1980, the Index designation affected the recording of the crime. Therefore, arson figures prior to 1980 are not comparable to 1980 and 1981 Index arson totals. For the other Index crimes, however, complete Illinois data are available for a ten-year period, 1972 through 1981.⁶

In summary, "Illinois Crime Trends" will provide the reader the following information:

- Ten-year patterns of change in each Index crime, deceptive practices, forgery, and vandalism in Illinois. Which crimes increased, which decreased, and which remained at about the same level? Was there an abrupt change in the direction of any of these patterns, for example, from an increase to a decrease? How do the crime patterns in Illinois compare to the crime patterns in the United States as a whole? Does the number of offenses known to the police in Illinois vary according to the seasons of the year? If so, do all types of crime vary in the same way?

- Differences between rural, suburban, and urban counties in the amount and type of crime in 1981. How do the 102 Illinois counties compare in the amount of crime known to the police per capita? How does the crime rate differ in counties with an urban, suburban, or rural character?

- Differences between rural, suburban and urban counties in crime trends. What was the ten year pattern of change in the number of crimes known to the police in Illinois urban, suburban, and rural counties? Did some kinds of crime increase in urban counties, but decrease in rural counties, or vice versa? Can these patterns be explained by changes in the population size?

⁵For the history of the Crime Index, see Maltz (1977).

⁶Chicago does not report non-Index crime data to the Department of Law Enforcement. Therefore, the deceptive practice, forgery and vandalism analyses in this report do not include Chicago.

CRIME IN THE STATE OF ILLINOIS

Index Crimes in 1981

The eight Index crimes vary widely in volume and relative seriousness. Violent crimes account for less than a tenth of the total number of Index crime offenses in Illinois. The most serious crimes tend to occur least often.

Total 1981 Illinois Index crime (figure 1) contains many more property than violent offenses. If we divide the property and violent pieces of the pie into their components, the less serious offenses usually outnumber the more serious offenses. For example, there were about twenty times as many aggravated assaults as murders known to the police, two and a half times as many larceny-thefts as burglaries, and over 250 times as many larceny-thefts as murders.

Index Crimes, 1972 and 1981

Not only do the Index crimes vary in the volume of offenses known to the police, they also vary greatly in the direction and amount of change since 1972. A comparison of the 1972 offense rate (the number of offenses per 100,000 population) to the 1981 offense rate shows that, overall, the total Index crime rate increased 27 percent (table 1a). However, although most Index crime rates increased, the robbery and aggravated assault rates decreased.

The rates for each of the three Index property crimes increased between 1972 and 1981. The most frequent crime, larceny-theft, had the greatest percent increase. (Data for 1972 are not available for the fourth property crime, arson).

The rates of the two most frequent Index violent crimes (robbery and aggravated assault) decreased between 1972 and 1981, while the rates of the other two violent crimes (murder and forcible rape) increased. The Index robbery rate decreased 23 percent, and the Index aggravated assault rate decreased ten percent. Because robbery and aggravated assault are more frequent than murder and forcible rape, their decreases caused the overall Index violent crime rate to decrease between 1972 and 1981. However, to say that Index violent crimes decreased would be misleading, since the two most serious violent crimes did not decrease.

Similarly, because there are more property crimes than violent crimes, and the property crime rates increased between 1972 and 1981, the total Index crime rate also increased. However, to say that Index crimes increased ignores the fact that robbery and aggravated assault decreased.

^a1972 Index arson figures do not exist.

^bArson not included.

Source: SAC Edition Illinois Uniform Crime Reports Offense data. 1981 figures are preliminary. U.S. Bureau of the Census, 1980 data.

In addition, it may be misleading to generalize about the percent change between two years. The decrease in the robbery rate between 1972 and 1981, for example, does not imply that the robbery rate decreased in every year of the ten year period. As we will see in a following section, robberies increased in the early years and decreased in the later years of the period. Therefore, to describe the pattern of change from 1972 through 1981, we must follow the increases and decreases from year to year of each Index crime.

Comparison to United States Rates, 1972 and 1980⁷

In 1972, the rate per 100,000 population of most Index crime offenses was higher in Illinois than in the nation as a whole (table 1b). However, by 1980, the opposite was true. Most 1980 Illinois rates were lower than the national rates, because national Index crime rates increased faster than Illinois rates between 1972 and 1980.

⁷This section uses only 1972 and 1980 rates, because 1981 national rates are not yet available. The information in this section is similar to the analysis of 1972 to 1979 in the SAC publication, Violent Crime in Illinois.

⁸As we will see in the next section, Illinois Index crimes did not increase every year throughout the nine year period, but decreased during some years.

Table 1b

ILLINOIS AND NATIONAL INDEX CRIME, 1972 AND 1980
REPORTED OFFENSE RATES PER 100,000 POPULATION

Index Crime	1972 Rate		1980 Rate	
	Illinois	National	Illinois	National

Arson	a	a	44.3	a

^a1972 Index arson figures do not exist. National arson rates are not included in Crime in the U.S., 1980.

Sources: National data, Crime in the U.S., 1980; Illinois, SAC Edition Illinois Uniform Crime Reports Offense Data. U.S. Bureau of the Census.

Index murder was an exception. The Illinois and national rates were about the same, both in 1972 and in 1980. For other violent Index crimes, however, the rate of increase was much higher in the United States as a whole than in Illinois. The Index robbery rate in Illinois, in fact, decreased by 18 percent between 1972 and 1980, while it increased 34 percent nationally. The Index forcible rape rate increased 13 percent in Illinois, but 60 percent nationally. The aggravated assault rate increased 54 percent nationally between 1972 and 1980, but increased only seven percent in Illinois in the same period. As we saw in the last section, Illinois robbery continued to decrease between 1980 and 1981. However, as we will see in the next section, the direction of change in the aggravated assault rate shifted.

Of the Index property crime rates, burglary was also an exception to the general pattern. The Illinois rate was lower than the national rate in both years--1972 and 1980. However, the percent increase between 1972 and 1980 was about the same in Illinois as in the United States as a whole. Index larceny-theft and motor vehicle theft rates, on the other hand, increased less than the national rates. Because 1972 data are not available, we can say nothing about the change over time in the Index arson rate.

Summary

This section has compared the Index crimes in their volume and rate per 100,000 population, and in their change between the years 1972 and 1981. However, as we have seen, these general, overall comparisons can be misleading. Just as an analysis of total Index crime may obscure differences from one Index crime to another, an analysis comparing crime rates ten years apart may obscure year-to-year differences within that ten year period. To describe the pattern of change in crime from 1972 to 1981, we must ask whether or not there was a change in the pattern at some point, for example, from an increase to a decrease. To answer this question, the following section describes the pattern of each Index crime, deceptive practices, forgery and vandalism, from year to year. In addition, for even more detail, it describes the patterns of each Index crime from month to month.

We use graphs to describe these yearly and monthly patterns. Because the Index crimes vary so greatly in their frequency, the scales of the graphs are not all the same. If we had graphed the murder pattern, for example, on the same scale as the larceny-theft pattern, the murder pattern would have been impossible to see. On the other hand, with different scales, what appears to be a small change from year to year on a large scale may appear to be a large change on a small scale. Therefore it is important to keep in mind that, for example, an increase in murders may appear to be larger than the same increase in larceny-thefts. In addition, a change in a less serious crime may not be directly comparable to a change in a more serious crime. A ten percent increase in murder may not have the same effect on the community as a ten percent increase in larceny-theft.

Another caution in comparing Index crimes is that they vary in the degree to which they reflect the number of victimizations actually occurring. Research indicates a relationship between the seriousness of a crime and the proportion that becomes known to the police. The more serious the crime, the more likely the victim will report it to the police, and the more likely the police will investigate the report and record it as a crime in official records. Thus, for example, the proportion of murder victimizations that are included as Index murders is probably greater than the proportion of aggravated assault victimizations that are included as Index aggravated assaults. In addition, the ease or difficulty of the victim's decision to report a crime to the police affects the reporting rate. Because of insurance regulations, motor vehicle thefts are very highly reported. On the other hand, many women feel some constraint in reporting a rape.¹⁰

⁹For a review of this question, see the SAC publication, Decisions and Data: The Transformation of a Robbery Incident into an Official Robbery Statistic.

¹⁰For discussions of the victim's decision to report, see Hindelang and Gottfredson (1976), Skogan (1976), and Hindelang, Gottfredson, and Garofalo (1978).

Although the correspondence between the number of victimizations and the number of offenses known to the police may affect the comparison of one Index crime to another, it is much less likely to affect the general pattern of change over time in a single Index crime. If we can assume that the tendency of victims to report a crime has not changed over time, then the pattern of change in reported crime will reflect the pattern of change in victimizations.¹¹ Describing trends in each individual crime is the task of the remainder of this report.

¹¹For some crimes, especially forcible rape, the assumption that victim reporting practices have not changed over time is dubious.

PATTERNS OF CHANGE IN ILLINOIS, 1972 THROUGH 1981

Analysis Methods for Change Over Time

This section first describes patterns of change in the number of offenses per year, and then describes patterns of change in the number of offenses per month. More detail can be seen in a monthly analysis than in a yearly analysis, but the description of the pattern of change over time in 120 months requires somewhat different methods of analysis than the description of the pattern in ten years. First, if we have 120 monthly observations instead of 10 yearly observations, it is helpful to have a simplifying summary of the overall pattern. The "time series pattern description" method provides this simple description. Second, since the pattern of monthly data might be obscured by seasonal fluctuations, we must test the data for the presence of seasonality.

Pattern Description. To describe the general pattern of change over time in the number of offenses per month, we use "linear spline regression," which finds a segmented line that fits the data better than alternative segmented lines. We call this segmented line a "time series pattern description."

A time series pattern description will indicate whether the number of offenses per month increased, decreased, or stayed at about the same level over time. It will also indicate whether there was an abrupt change in the pattern, such as a change from an increase to a decrease, and if there was, it will show roughly when the change occurred. However, it will not forecast, nor will it allow you to test a prediction that change occurred at a particular time. It is only a general pattern description. It is not an explanation.¹²

Seasonality. Monthly patterns can be affected by seasonality. That is, certain months might tend to have more offenses than others. If a crime is seasonal, the seasonal fluctuations might obscure the overall pattern of change over time. Therefore, we have tested each monthly series in this report for the presence of seasonality, and if seasonal fluctuation is present, we removed that fluctuation to produce a "seasonally adjusted" series.¹³ We then described the pattern of change over time of this seasonally adjusted series.

¹²For more information about time series pattern description, see the SAC publication, Pattern Description Manual.

¹³Our test for the presence of seasonality uses the X-11 seasonal adjustment program developed by the U. S. Bureau of the Census. For more information, see the SAC publication, Descriptive Time Series Analysis for Criminal Justice Decision Makers.

Violent Index Crime

How did the number of Index violent crime offenses known to the police vary over the ten years from 1972 to 1981? The general patterns can be seen in figure 2.¹⁴

The number of murder offenses, the most serious but the least frequent violent crime, varied little over the ten year period. The number of forcible rapes known to the police, however, fluctuated widely.

The total number of robberies known to the police in Illinois in any of these ten years is usually about the same as the total number of aggravated assaults. The patterns over time of the two crimes differ, however. Robbery generally decreased, while the number of aggravated assaults, like the number of forcible rapes, fluctuated.

Murder. At the beginning of 1972, there were just under 70 Index murders in Illinois in a typical month (figure 3). This increased to over 100 per month by mid-1973. Since 1973, the number of Index murders has remained fairly steady. It decreased slightly until mid-1977, and then increased slightly through 1981, but in general, Illinois had about 100 Index murders per month in the years from 1973 to 1981.

Index murder in Illinois is not seasonal. There is no tendency for some months to have more Index murder offenses than others. Therefore, there was no need to adjust the Index murder data for seasonality.

Forcible Rape. The number of Index forcible rapes in a typical month fluctuated from about 175 to 275 (figure 4). Despite the movement up and down, the number of Index forcible rapes in 1981 was about the same as the number in 1972. Thus, there was no general increasing or decreasing trend. The overall pattern is one of great fluctuation.

Some of the fluctuation is due to seasonality. The months from June to September tend to be high, and January tends to be low. This tendency, however, is not strong, and the pattern of seasonally adjusted Index rape shows the same fluctuations as the pattern in figure 4.

Robbery. Index robbery (figure 5) increased from about 2,200 per month at the beginning of 1972 to almost 3,000 per month at the end of 1974. September to December 1974 were

¹⁴Note that, because the numbers of murder and rape offenses per year are less than the numbers of robbery and aggravated assault offenses, the scale of the murder and rape graph is one-tenth the scale of the robbery and aggravated assault graph. Also note that 1981 figures are preliminary.

particularly high months for robbery in Illinois. (There were more than 4,000 in September 1974). In 1975 and 1976, however, the number of Index robberies in a typical month decreased sharply, until there were fewer than 2,000. There was little change from mid-1976 until the end of 1981.

Like Index forcible rape, Index robbery shows some seasonality. The months from August through December are usually a little higher than average. However, the pattern of change over time in seasonally adjusted Index robbery is exactly the same pattern as shown in figure 5.

Aggravated Assault. In contrast to the other violent Index crimes, Index aggravated assault shows a great deal of seasonality. June, July and August are usually high, and January and February are usually low. This strong seasonal fluctuation somewhat obscures the overall pattern of change. Therefore, we examined both the pattern of change over time of the actual

¹⁵ Assaults may be higher in the summer because there are more victimizations, or because victimizations are more likely to become known to the police.

number of Index aggravated assault offenses (figure 6), and the pattern of change over time of the assault offenses with the seasonal increases and decreases removed (see figure 7, seasonally adjusted aggravated assault).

In the original pattern (figure 6), there were about 2,300 Index aggravated assaults per month in 1973, a decrease to fewer than 2,000 in a typical month early in 1978, an increase to mid-1980, and then another decrease. The adjusted aggravated assault pattern (figure 7) is similar to the pattern in the yearly data (figure 2), but shows greater detail. Thus, Index aggravated assault increased from about 2,000 a month to over 2,500 a month between 1972 and mid-1974. It then decreased to about 1,800 a month in mid-1977, increased again through mid-1980, but never reached the peak level of 1974, and decreased to a new low by the end of 1981. Around this general pattern, the months fluctuated according to the season of the year.

Property Index Crime

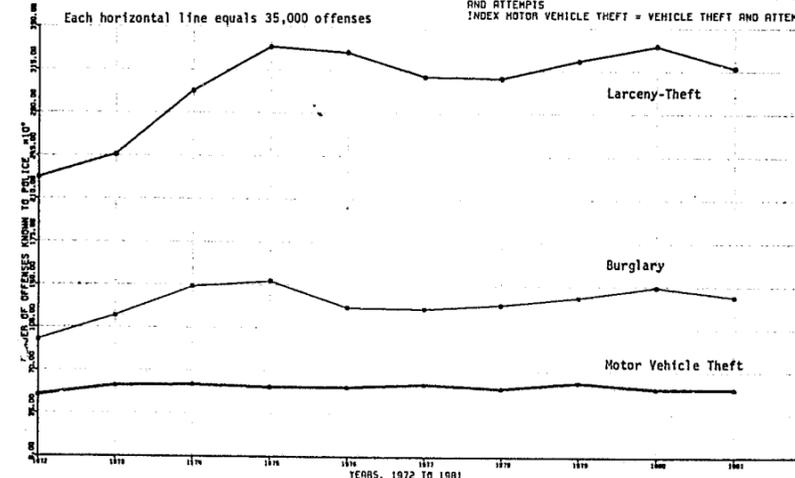

There are more than nine times as many Index property offenses as Index violent offenses in a typical year, but the pattern of change in the number of property offenses over the ten year period from 1972 through 1981 (figure 8) tended to be much more stable than the pattern of change in the number of violent crimes. Also, the property offenses tended to have more seasonal fluctuation than the violent offenses (except aggravated assault).

ILEC CRIMINAL JUSTICE INFORMATION SYSTEMS -
STATISTICAL ANALYSIS CENTER GRAPH

Burglary. Index burglary increased rapidly from under 6,800 offenses per month at the beginning of 1972 to almost 12,500 in a typical month by the end of 1974 (figure 9). It then decreased to under 9,800 late in 1976, and increased again, to almost 12,000 by the end of 1981.

Burglary had some seasonality, with August typically a little higher than the other months. This seasonal fluctuation is much more clearly present in the later years than in the earlier years.¹⁶ Although the amount of seasonal fluctuation is slight, it does obscure an interesting pattern in the graph. The seasonally adjusted burglary graph (figure 10) shows the same pattern as the nonadjusted graph from 1972 to 1979, but the adjusted graph decreases in 1980 and 1981.

Larceny-theft. Index larceny-theft not only occurs more often than any other Index crime, but also shows the most seasonal fluctuation of any Index crime (figure 11). June, July, and August typically have many more Index larceny-thefts, and January and February have many fewer. Overall, the number of larceny-thefts increased from a low fluctuating around 16,500 a month in 1972 to a high fluctuating around 27,000 a month in 1975. After 1975, the number of larceny-thefts in a typical month in Illinois stayed about the same.

Because of the large seasonal fluctuations, the pattern description of seasonally adjusted larceny-theft (figure 12) is not quite the same as the pattern of the original data. Seasonally adjusted larceny-theft shows two brief declines, one in 1972 and one in 1976.

In general, we can say that the number of Illinois Index larceny-theft offenses varied widely from the summer months to the winter months during these ten years, but that, along with these seasonal fluctuations, the typical number rose rapidly from 1973 through 1975, dropped in 1976, and has risen very gradually since then.

Motor Vehicle Theft. Index motor vehicle theft showed very little change except seasonal fluctuation throughout the ten year period (figure 13). It did increase somewhat in 1972 and 1973, from about 3,500 to about 4,800 offenses in a typical month. After that, however, it remained at about 4,800 through 1981.

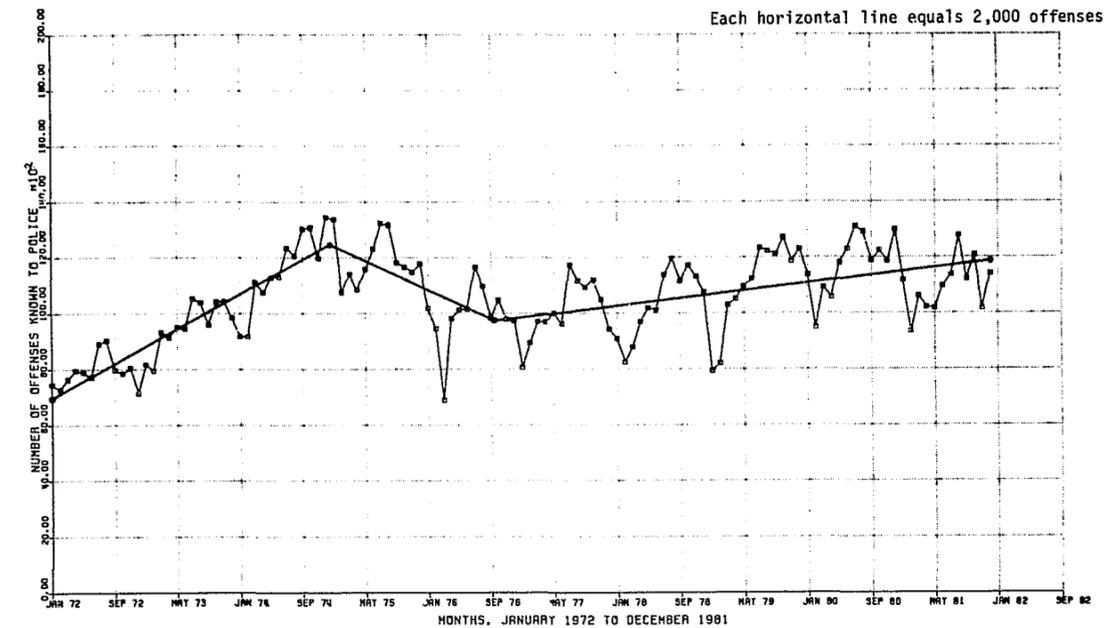

October tends to have more Index motor vehicle thefts, and January and February tend to have fewer. From 1972 to mid-1979, the seasonally adjusted pattern (figure 14) is the same as the

¹⁶Increasing seasonality after 1974 is either due to an increase in the seasonality of all burglary victimizations, or to an increase in the tendency of some burglary victimizations, which are seasonal, to become known to the police.

pattern of the unadjusted series, but it decreases slightly in the final years, from mid-1979 through 1981. In this respect, the pattern of Index burglary and the pattern of Index motor vehicle theft are similar. Both of the seasonally adjusted series declined slightly in recent years.

Arson. Index arson data are available only for 1980 and 1981. In 1980, there were 5,066 Index arson offenses in Illinois, and in 1981, there were 5,108. Any time series pattern description of Index arson must await the accumulation of more years of data.

Deceptive Practices, Forgery, Vandalism¹⁷

The number of deceptive practice offenses known to the police per year more than doubled in Illinois outside of Chicago between 1972 and 1981, from about 6,200 to over 13,000 (figure 15). The number of forgery offenses known to the police also increased steadily, but not as rapidly as deceptive practices. Between 1972 and 1980, the number of forgery offenses in a year rose from just over 2,300 to 4,400. However, it decreased in 1981 to about 4,100.

Vandalism was the most prevalent crime of these three non-Index crimes, numbering over 142,000 in 1981 in Illinois excluding Chicago (figure 16). Vandalism offenses known to the police increased steadily from about 65,000 in 1972 to over 165,000 in 1979, but then dropped. By 1981, there were about 147,500 reported vandalisms outside of Chicago. Despite this recent decrease, vandalism offenses more than doubled between 1972 and 1981.

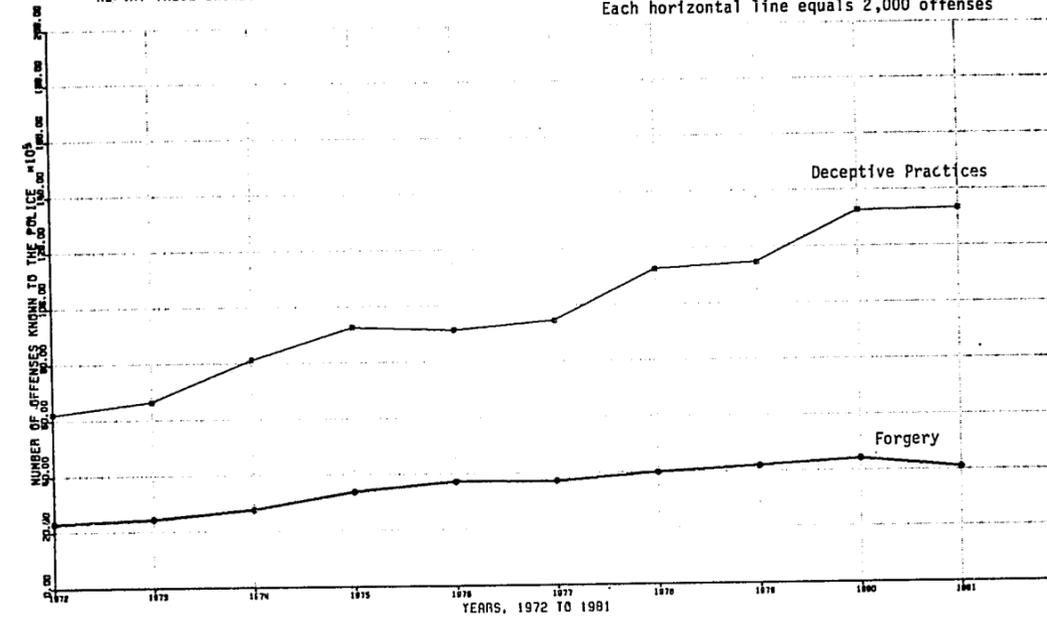

¹⁷See the appendix for definitions. These data do not include Chicago, because Chicago does not report non-Index crime data to the Department of Law Enforcement. See Kok (1979).

CRIME IN URBAN AND RURAL COUNTIES

Definitions of County Population Categories

Illinois is a diverse state. According to the 1980 census, its 102 counties range in population from 4,404 (Pope County) to 5,253,655 (Cook County).¹⁸ Because rural, suburban and urban areas may experience different amounts of crime and different types of crime, this section of the report analyzes crime trends within five categories of Illinois counties. Our category system corresponds roughly to population size and density, and urban versus rural character.

The five county types (map 2) are the following:

- Cook County, which contains Chicago.
- Urban SMSA Counties (15 counties).¹⁹ These counties have a city of 25,000 or more, and are in a metropolitan area.
- Urban non-SMSA Counties (6 counties). These counties have a city of 25,000 or more, but are not in a metropolitan area.
- Suburban SMSA Counties (7 counties). These counties are in a metropolitan area, but do not have a city of 25,000 or more.
- Rural Counties (73 counties). These counties have no city over 25,000, and are not in a metropolitan area.

Exact definitions of the county types, as well as additional maps, appear in the appendix.

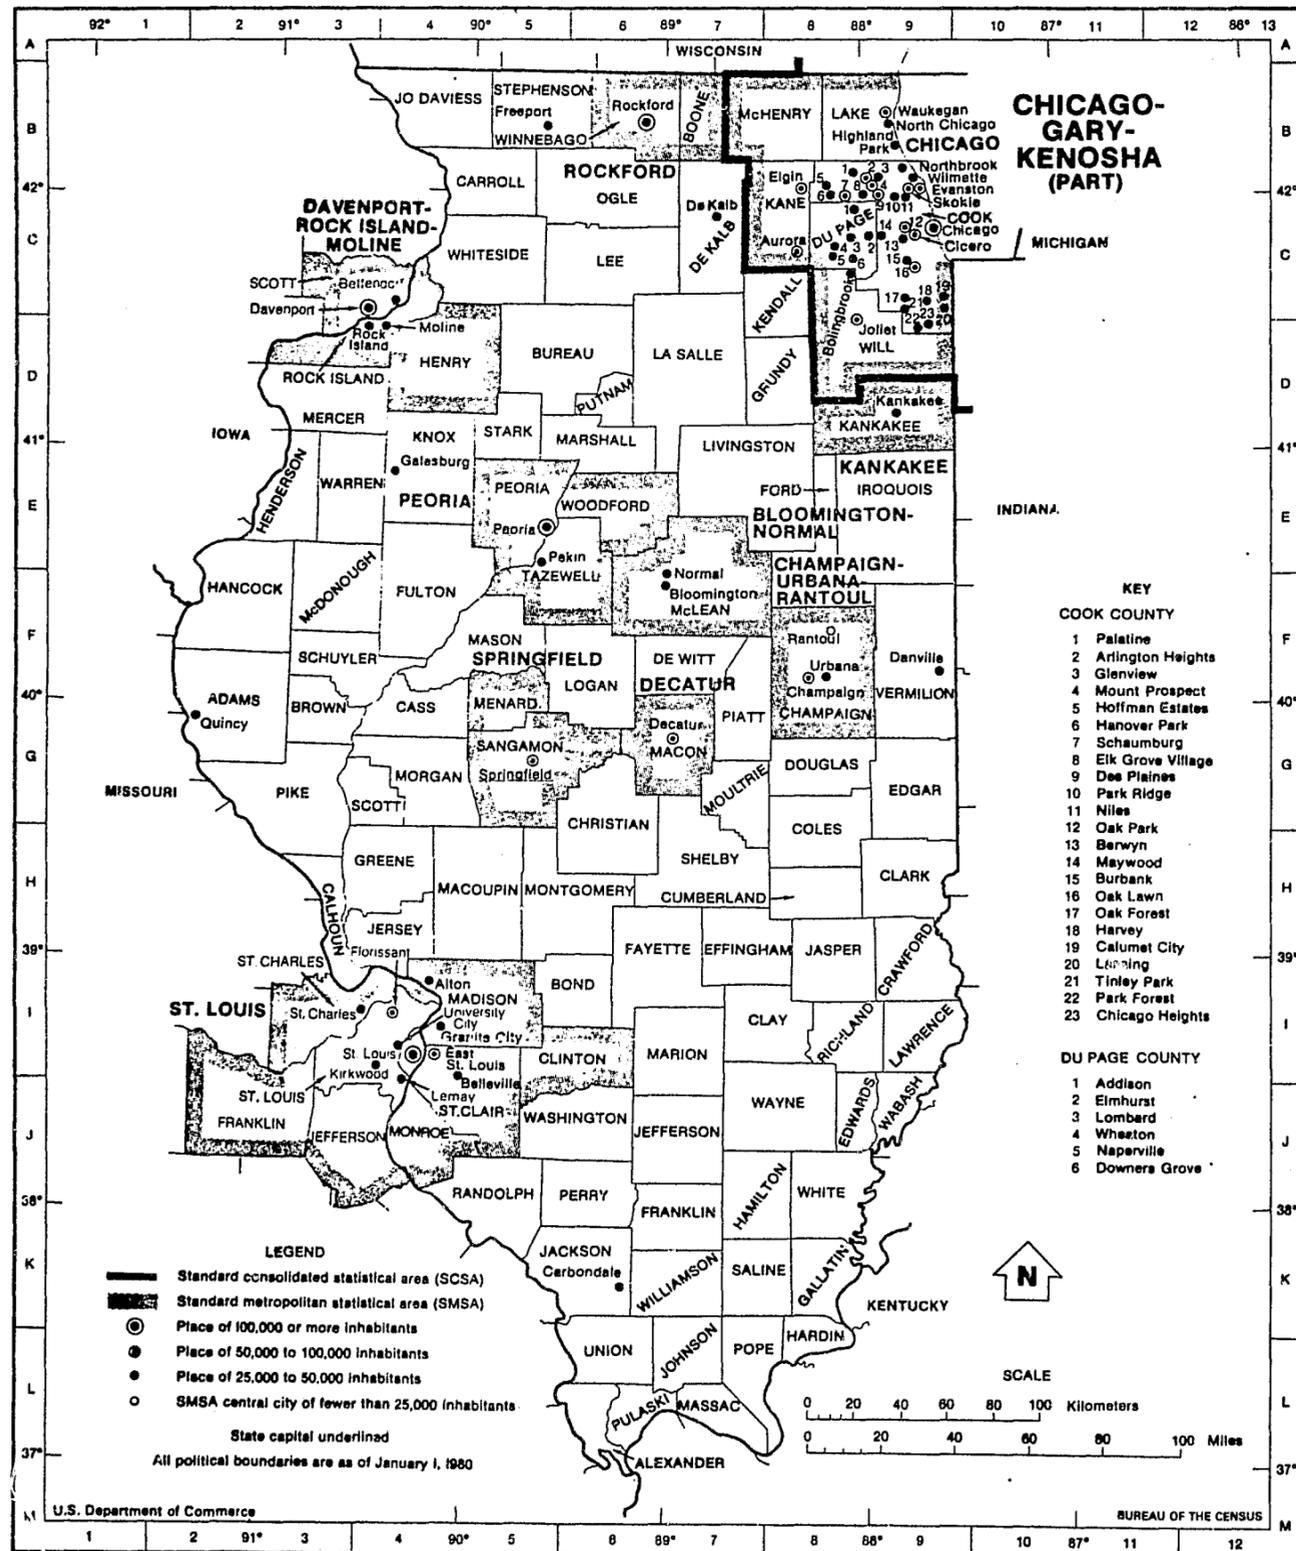

The five county categories form a rough scale, from greater to less urbanization, population, and density (table 2). Cook is the most densely populated of the five county categories, with 5,484 residents per square mile. The fifteen urban SMSA counties, as a group, are the next most densely populated,

¹⁸See appendix for individual county populations.

¹⁹The U.S. Bureau of the Census defines the Standard Metropolitan Statistical Areas (SMSA's) as follows: Each SMSA has one or more central counties containing the area's main population concentration: an urbanized area with at least 50,000 inhabitants. An SMSA may also include outlying counties which have close economic and social relationships with the central counties. The outlying counties must have a specified level of commuting to the central counties and must also meet certain standards regarding metropolitan character, such as population density, urban population, and population growth. (U.S. Bureau of the Census, 1982: A-4)

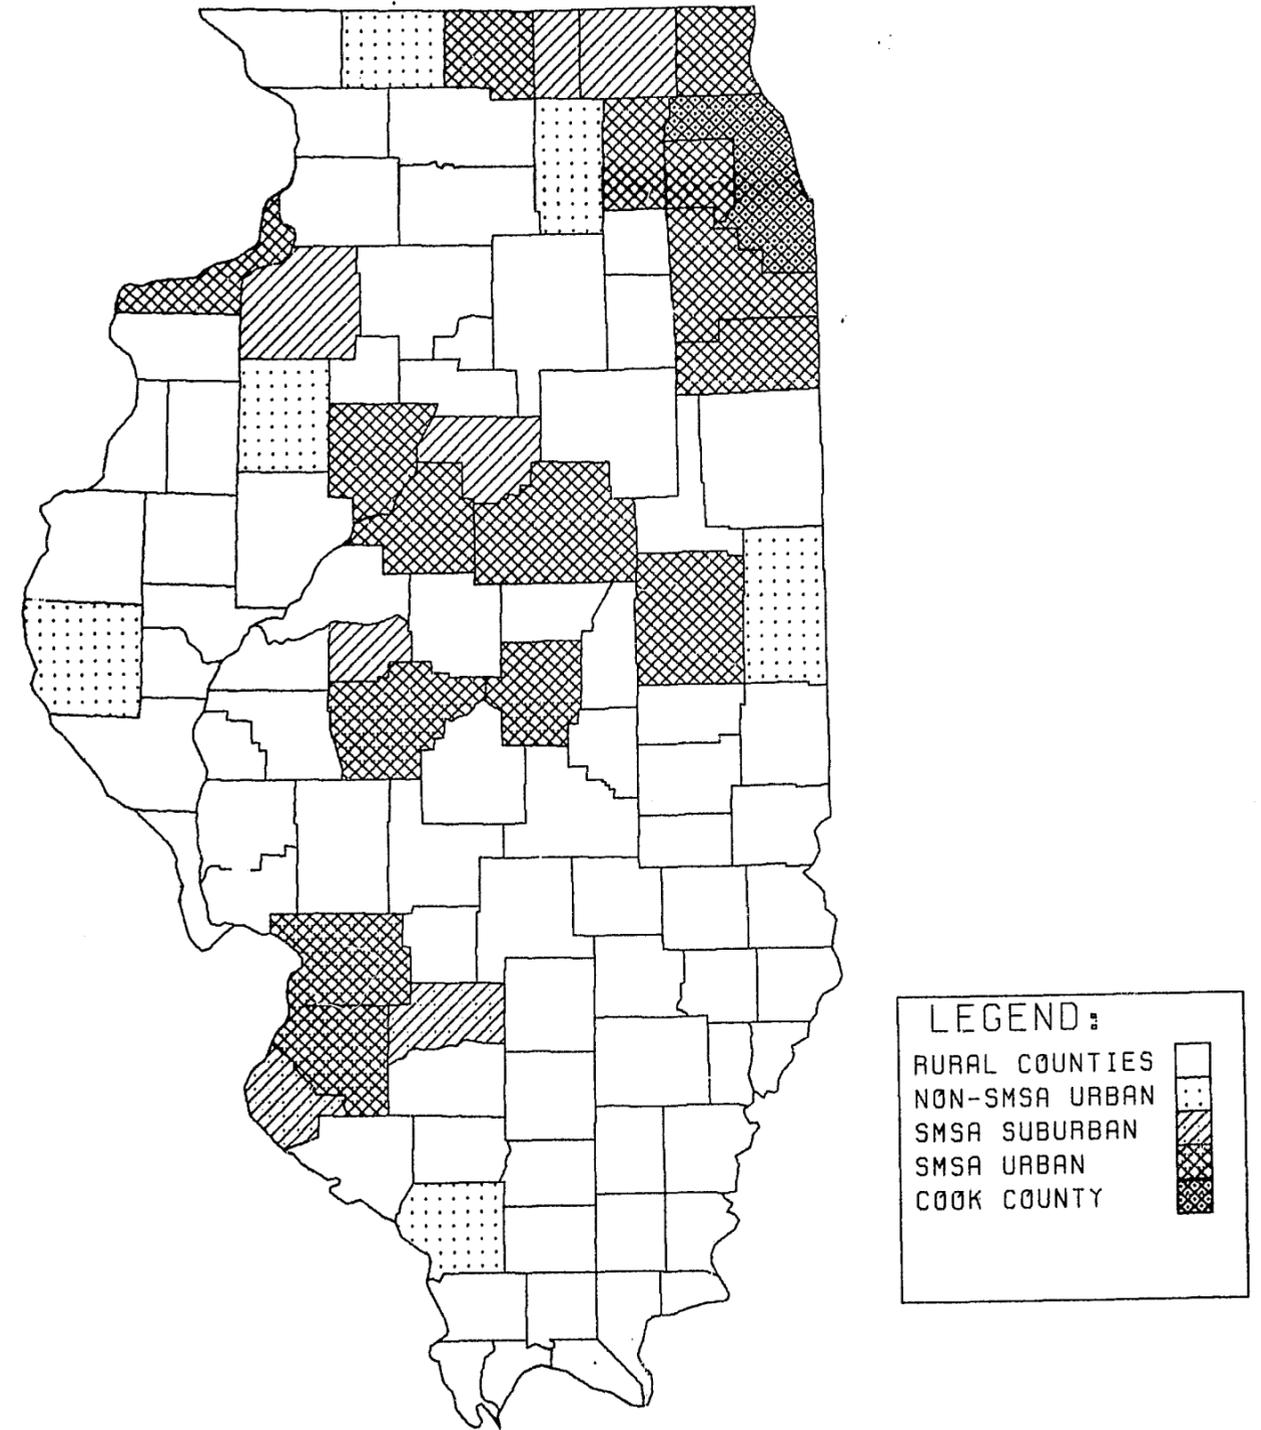

Map 1

Standard Consolidated Statistical Area, Standard Metropolitan Statistical Areas, Counties, and Selected Places

Map 2

ILLINOIS COUNTY POPULATION GROUPINGS

followed by the suburban SMSA and the urban non-SMSA (a tie), and finally, by the rural counties. Cook is fifteen times as dense as the urban SMSA counties, which are over four times as dense as the next two county types, which are twice as dense as the 73 rural counties as a whole.

The Illinois population increased about two percent between 1972 and 1980, but the same increase did not occur in every county group. Cook County decreased by five percent, and the seven suburban SMSA counties as a whole increased by 18 percent. Despite this, Cook County still contains almost half of the Illinois population, while only three percent live in the suburban SMSA counties. The urban SMSA counties have about a third of the population. Fifteen percent live in one of the 73 rural counties.

Crime Rates by County Type, 1981

How is crime distributed among Illinois counties? We might expect that the distribution of Illinois crime among the five county groups would be the same as the distribution of the population. That is, if 46 percent of the population live in Cook County, then we might expect about 46 percent of the crime to occur in Cook County. On the other hand, if urbanization is related to the amount of crime, then the urban counties should have still more crime than their share of the population, and the rural counties should have even less.

While the distribution of Index crimes among the five county groups is similar to the distribution of the population, the correspondence between the two distributions is not exact (table 3). Cook County has more than its share relative to its population, and the rural counties have less than their share.

The differences in distribution are more pronounced for the violent crimes than for the property crimes.²⁰ Cook County contained 46 percent of the Illinois population, but accounted for 64 percent of the Illinois violent Index crime offenses in 1981. At the other end of the scale, the rural counties had fifteen percent of the population, but only four percent of the violent crime. Although Index property crimes are more evenly distributed relative to the distribution of the population, 51 percent of the 1981 property crime occurred in Cook County, which is slightly more than the percent of the Illinois population living in Cook County. The urban SMSA counties had about the same percent of both Illinois violent and property crime as their percent of the population.

The crime rate reflects this distribution of crime relative to the distribution of the population.²¹ As table 3 shows, Cook County had the highest violent crime rate of the five county groups, and the suburban counties, as a group, had the lowest. The suburban SMSA's violent crime rate was even lower than the rate in the rural counties. In general, we can say that the rural and suburban counties, as a group, have the lowest violent crime rates, the urban SMSA and urban non-SMSA counties have medium high violent crime rates, and Cook County has a high violent crime rate.

²⁰Because Chicago data are not available for deceptive practices, forgery or vandalism, a distribution analysis such as table 3 would be misleading for these crimes.

²¹The crime rate divides the number of crimes by the number of people in the population. It is the number of crimes per 100,000 population. For example, Cook County had 32,421 violent Index crimes in 1981, and its population (using 1980 figures) was 5,253,655. The violent crime rate was, therefore, 617 per 100,000. In Adams county, the number of violent crimes was 141, and the population was 71,622, making the violent crime rate 197 per 100,000 (see appendix).

For property crimes, the highest rate in 1981 was in the urban SMSA counties, as a group. Cook and the urban non-SMSA counties were somewhat lower, and the suburban SMSA and rural counties, as a whole, were much lower.

Thus, urban county groups tend to have higher crime rates than rural or suburban county groups. However, we cannot conclude from this that each suburban or rural Illinois county has low crime rates. Actually, the counties within each group vary considerably in the amount and type of Index crime offenses.²² If we divide the counties into four categories according to their 1981 Index crime rates (table 4), we see that

Table 4

VIOLENT AND PROPERTY INDEX CRIME RATES BY COUNTY TYPE^a

^bSee the text for definitions.

²²For a discussion, see the SAC publication, Aggregation Problems in the Analysis of Illinois Statewide Criminal Justice Data.

most suburban and rural counties have lower violent crime rates than the other county groups.²³ Of the 73 rural counties, 45 are in the lowest category of violent crime rates. On the other hand, not every county follows this general pattern. A number of rural counties had high or very high Index crime rates in 1981, some of the urban and suburban counties had low rates, and Cook County's property crime rate was not in the very high category. The following section compares the 1981 violent and property rates in each Illinois county.

²³The four categories for violent Index crime rates are: Low (0-100 offenses per 100,000), Medium (101-300), High (301-500), and Very High (over 500). For property crime rates, the categories are larger by a factor of ten: Low (0-1000), Medium (1001-3000), High (3001-5000), and Very High (over 5000). Actual rates for each county appear in the appendix. Because 1981 population data are not available, the rates are calculated with 1980 population figures.

Violent and Property Crime Rates in Each County, 1981

The violent crime rate for the state as a whole was 441 per 100,000 population in 1981, and the property crime rate was 4,463. Although most urban counties have higher crime rates than these, and most rural counties have lower crime rates, there are a number of exceptions to this general pattern. Map 3 (Index violent crime) and map 4 (Index property crime) show both the urban or rural group and the crime rate category for each Illinois county. The shading of each county indicates its rural-urban type. The county's violent or property crime rate is indicated by a number from 1 (low) to 4 (very high).²⁴

The great majority of rural counties had low or medium violent Index crime rates in 1981, but two rural counties had high, and two had very high, rates. A rural county, Alexander, had the highest Index violent crime rate in Illinois in 1981 (1,761), and Alexander County's neighbor, Pulaski County, had a rate of 565, which was higher than the violent Index crime rate for the state as a whole. (See the appendix for the rank order of each county in violent and property crime rates).

Illinois counties with low or medium property crime rates in 1981 were very likely to be rural counties. On the other hand, Alexander County's property crime rate was very high (5,602), and ten other rural counties had high rates.

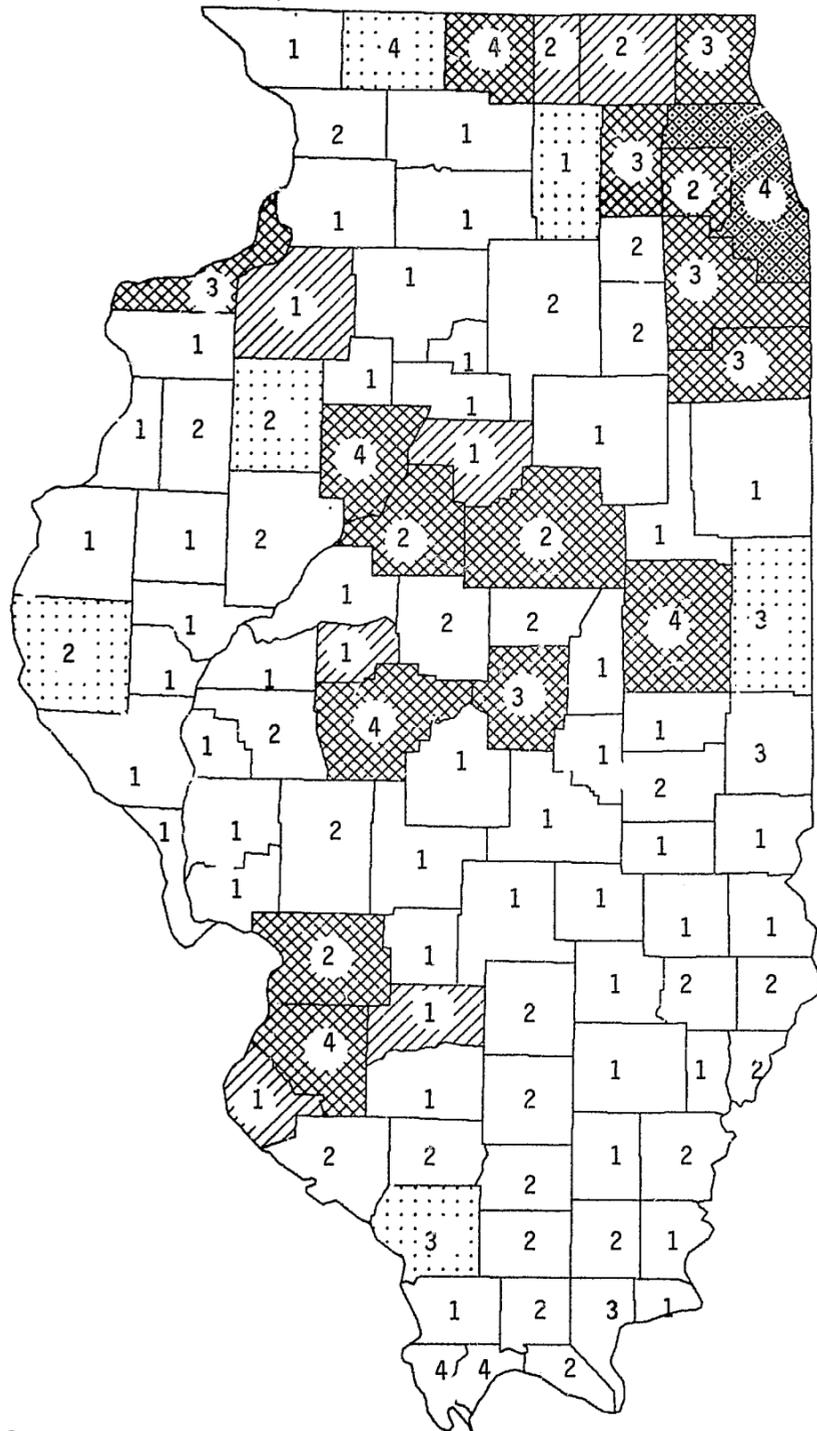

The suburban SMSA counties tended to have lower crime rates than the urban non-SMSA counties. The second lowest violent Index crime rate in Illinois occurred in a suburban SMSA county, Clinton, which had a rate of only 3 per 100,000 population. The highest violent crime rate of any suburban SMSA county in 1981 was in Boone, which had a rate of 133. Of the six non-SMSA urban counties, one had a very low violent crime rate (DeKalb, 98), another had a very high rate (Stephenson, 517), and the other four had medium or high rates.

The only Illinois county other than a rural county with a low property crime rate was a suburban SMSA county, Clinton. Five of the seven suburban SMSA counties had low or medium property crime rates. McHenry county had a high rate (3,425), while Boone had a very high rate (5,648). Of the six urban non-SMSA counties, all but Knox had high property crime rates. The Knox rate (5,301) falls into the "very high" category.

None of the fifteen urban SMSA counties had a low Index violent crime rate. The lowest in this group was Tazewell, with 150. Five of the fifteen had very high violent crime rates, the highest being Peoria (804), followed by St. Clair (619). These two counties, along with the rural county Alexander (1,761), were the only counties to have higher Index violent crime rates than Cook County's 617 per 100,000 population.

²⁴ See note 23, above, for definitions. For maps showing the counties that had 1981 violent or property Index crime rates above the rates for total Illinois as a whole, see the appendix.

^a Index Property crimes include burglary, larceny-theft, and motor vehicle theft. Sources: SAC Edition IUCR Offense Data, 1981 preliminary figures. U.S. Bureau of the Census 1980 population data. Rates are based on 1980 population.

All but one of the 15 urban SMSA counties had high or very high Index property crime rates. Tazewell had a medium rate (2,752). Winnebago had the highest rate in this group (7,008), which was also the highest property crime rate of any county in the state. Cook County had a high property crime rate (4,952), but this rate was lower than the rates of twelve other counties.

Every county had a higher property crime rate than a violent crime rate, and most had property crime rates that fell into the same category in our ranking system as their violent crime rate fell.²⁵ On the other hand, a few counties had relatively low property crime rates but relatively high violent crime rates. Johnson County had a very low property crime rate (353), but a medium violent crime rate. Pulaski County had a low property crime rate, but a very high violent crime rate (566). Pope County had a medium property crime rate, but a high violent crime rate (318). Likewise, Stephenson, St. Clair, and Cook Counties had very high Index violent crime rates, but only high property crime rates.

²⁵ Many rural counties had low violent but medium property crime rates, but this was an artifact of our crime rate categories. Because we made our violent crime categories one-tenth of our property crime categories, there are fewer counties with low property crime rates than low violent crime rates. See the "Total" row in table 4.

PATTERNS OF CHANGE IN URBAN AND RURAL COUNTIES

In Illinois as a whole, Index violent crime rates declined 14 percent from 1972 to 1981, while Index property crime rates increased by 34 percent (table 5).²⁶ The type of county, however, made a great difference in the change over time of the crime rates.

With one exception, the more urban the county group (on our rough population scale), the less the violent or property Index crime rate increased between 1972 and 1981. The exception was the urban non-SMSA group, which had a higher percent increase than any other group in both violent Index crime (+58%) and property Index crime (+84%). Violent and property crime rates in the rural group increased almost as much, and the property crime rate increase in the suburban SMSA counties, as a whole, was also rapid. In contrast, the property crime rate in Cook County increased less than twenty percent, and the violent crime rate actually decreased by twenty percent.

Table 5
CHANGE IN INDEX CRIME RATES,^a 1972-1981

County Rate	Violent Crime			Property Crime ^b

^aOffenses known to the police per 100,000 1980 population.

^bNot including arson.

Sources: SAC Edition Illinois Uniform Crime Reports Offense Data, 1981 preliminary figures; U.S. Bureau of the Census.

²⁶Because 1972 and 1980, but not 1981, population figures are available, tables 6 and 7 contain 1981 rates based on 1980 population. Index arson is not included, because 1972 data are not available.

The Index arson offense rates in 1980 and 1981 were lowest in the rural and suburban SMSA county groups (table 6). The highest Index arson rates per 100,000 population occurred in Cook County. The urban SMSA and non-SMSA county groups had arson rates that were slightly lower than Cook County's rates. Because data are not available prior to 1980, it is not possible to analyze ten year increases or decreases.

Table 6

Vandalism (outside of Chicago) seems to bear the same relationship to urbanization as do the Index violent and property crime rates (table 7). The more urban the county group, the less the vandalism rate increased, except for urban non-SMSA counties. The urban non-SMSA county group rose the fastest in the vandalism rate, increasing by over 250 percent.

On the other hand, the suburban SMSA counties, as a group, show the greatest increase in the deceptive practice offense rate, and the second greatest increase in the forgery rate over the ten year period. Although the rural counties increased very little in deceptive practices, their increase in the forgery rate was greater than any other county group.

These crime rates show differences between rural and urban county groups in crime relative to population, but they do not show increases and decreases over time in the actual number of

criminal offenses. Police officials, prosecutors and courts must deal with each criminal case, not the crime rate. Therefore, the following section shows how the number of occurrences, known to the police, of each Index crime (except arson), and deceptive practice, forgery and vandalism changed over the ten year period in each of the five rural-urban county groups.²⁷ For most of these crimes, we show yearly patterns, but because of the interesting rural-urban differences, we also analyze the more detailed monthly patterns for Index robbery and aggravated assault.

²⁷As we saw in the above section, not all rural counties correspond to the general rural pattern. This is undoubtedly also true of patterns of change over time. If we had examined the ten year pattern of each crime within each county, however, the results would have been much too voluminous for this report. Therefore, this section describes the patterns of each of the five county groups.

Violent Index Crime

Murder. In general, most of the change over the ten years in Index murder occurred in Cook County and in the rural county group. Cook County had a high number of murders in 1974, and the number of murders in the rural counties increased to a high in 1981.

Because the great majority (about 70%) of Illinois murders occur in Chicago, the pattern over time of Cook County Index murder (figure 18) is similar to the pattern for total Illinois (figure 2). The number of murder offenses peaked in 1974, then decreased and leveled off.

In the urban SMSA counties, about 150 to 200 Index murders occurred each year over the ten year period (figure 19).²⁸ Although the number in 1974 was high, as in Cook County, the number in 1976 was even higher. The urban non-SMSA and suburban SMSA counties varied little over time, but the number of Index murders in the rural counties followed quite a different pattern than the other four groups. The lowest number of Index murders in the rural county group occurred in 1974. This was followed by an increase to 1976, a decrease through 1978, and then another increase to a ten year high of 44 Index murders in 1981.

Forcible Rape. In most Illinois county groups, 1979 or 1980 were peak years for Index forcible rape offenses known to the police.

The number of Index rape offenses in Cook County (figure 20) followed the total Illinois pattern. The pattern over time of Index forcible rape in Cook County accounts for most of the fluctuating pattern in Illinois as a whole.

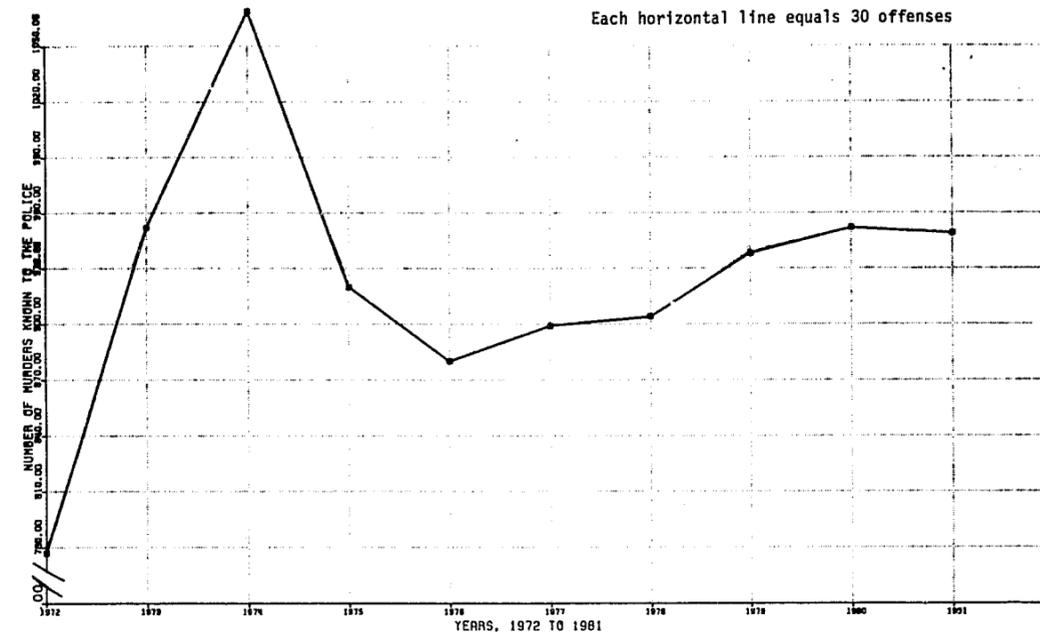

The other four county groups all show overall increases in Index rape offenses for the ten year period, especially in the more recent years (figure 21). In the urban SMSA counties, the number increased steadily between 1972 and 1978, and did not peak in 1974. From 1978 to 1979, Index forcible rapes known to the police increased sharply, from about 800 to about 1,000. The number remained high in 1980, but fell in 1981.

In the suburban SMSA counties, Index forcible rape offenses generally decreased, from 17 in 1972 to 9 in 1976, and generally increased afterwards to a high of 33 in 1981. In the urban non-SMSA counties, there was a fairly steady increase from 1972 to 1977, a decrease to 1979, and then a large increase in 1980. In 1981, the number decreased back to 1977 levels. Like the urban SMSA counties, the rural counties, as a whole, increased in 1979 and 1980. There were fewer than 100 Index rape offenses known to the police in rural counties in any year from 1972 to 1978, but over 125 in 1979, 1980 and 1981.

²⁸Note that the scales of figures 18 and 19 are the same, but figure 18 begins at 750 offenses, while figure 19 begins at zero.

Robbery. As we have shown above, robbery is an urban crime. Like Index murder and forcible rape, the Cook County pattern of reported robberies (figure 22) follows the total Illinois pattern almost exactly.

The urban SMSA and non-SMSA counties (figure 23) also show the same general pattern, although the urban SMSA decrease occurred mostly in 1976, with a levelling off after that. In the urban non-SMSA counties, robberies decreased from 1974 to 1976, increased again in 1977, and decreased and levelled off beginning in 1978. Index robberies in the suburban SMSA counties stayed at about the same level, 35 to 60 a year, throughout the period.

In the rural counties, Index robbery offenses peaked in 1975, decreased to 1977, then increased and levelled off after 1978. There was a slight decline in 1981.

Thus, counties with a city over 25,000 show similar patterns of robbery over the ten year period. This similarity is even more apparent in the detailed monthly patterns, analyzed in the following section.

Aggravated Assault. Cook County and the urban SMSA counties are remarkably similar in their patterns of Index aggravated assault offenses (figure 24). They have the same fluctuations at the same times. However, overriding these fluctuations, the number of Index assaults in Cook County decreased from 1972 to 1981. There was a large decline of about 3,000 offenses between 1980 and 1981. The urban SMSA counties, as a group, did not experience such an overall decline. The number of Index aggravated assault offenses in 1981 was higher than in 1972.

The ten year patterns of the three remaining county groups (figure 25) are completely different from the patterns in Cook County and the urban SMSA counties. The suburban SMSA counties, as a group, peaked in 1974 and 1980, with the overall pattern being a slight increase. The rural and urban non-SMSA counties also increased in Index aggravated assaults offenses over the ten year period. The increase in the rural counties was especially great, from 900 in 1975 to over 1,800 in 1980. Index assault in the urban non-SMSA counties decreased in the final three years.

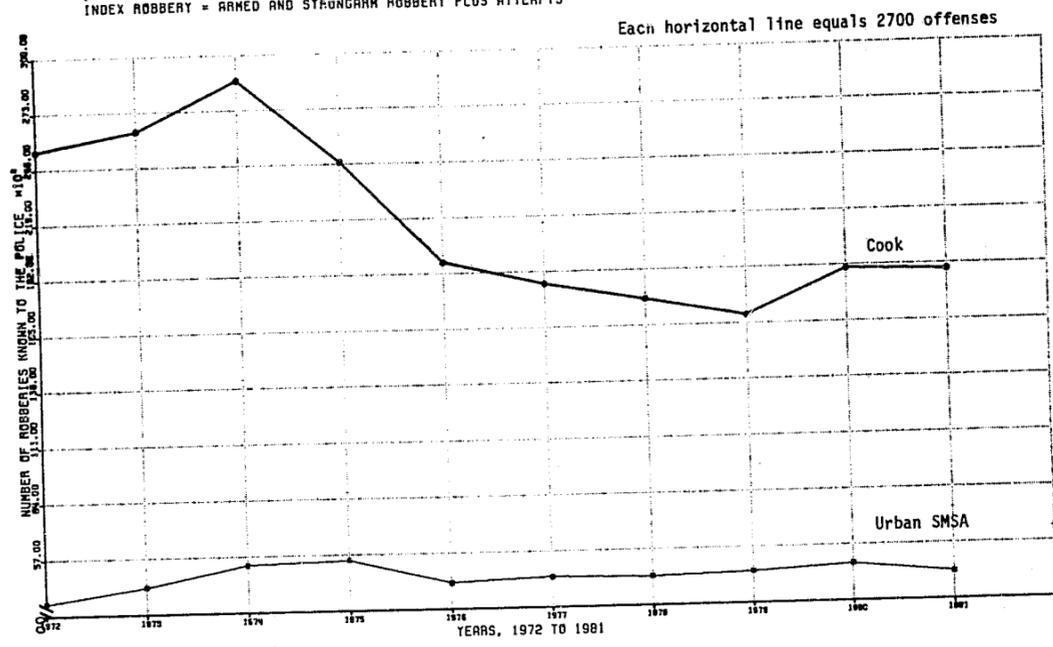

The urban-rural differences in aggravated assault trends can be seen more clearly in the detailed analysis of the number of offenses per month, in the following section.

Property Index Crime

Burglary. As with aggravated assault, Cook County and the urban SMSA counties are almost identical in their patterns over time of Index burglary offenses. However, Index burglary in the urban SMSA counties, as a whole, increased rapidly from 1976 to 1980, while the number of Index burglaries in Cook County changed very little.

The three remaining county groups have generally increasing patterns of reported burglaries between 1972 and 1981 (figure 27). All increased to highs in 1975, and, after brief declines, increased to new highs at the end of the period.

Larceny-Theft. All of the county groups other than Cook County (figure 28) showed overall increases in the number of Index larceny-theft offenses between 1972 and 1980. Rural counties (figure 29) showed the most continuous increase, with Index larceny-thefts known to the police more than doubling in ten years.

In Cook County, on the other hand, Index larceny-theft offenses increased rapidly to 1975, but then decreased steadily to 1981. This decrease apparently offsets the increases in the other county groups, producing the level number of Index larceny-theft offenses in the pattern of Illinois as a whole (figure 8).

Motor Vehicle Theft. In general, Index motor vehicle theft offenses were steady over the ten year period everywhere in Illinois, except in the rural county group.

In Cook County, and in the urban SMSA counties as a whole, motor vehicle thefts remained at a steady level after 1973 (figure 30). The urban SMSA counties, however, decreased after 1979. The suburban SMSA counties (figure 31) showed an overall increase, and the urban non-SMSA counties showed an overall decline, especially after 1979.

The only real change in the pattern over time of Index motor vehicle theft offenses occurred in the rural counties. As a group, the rural counties increased very rapidly to 1978, leveled off for two years, and then decreased in 1981.

Deceptive Practices, Forgery, Vandalism

Of the five county types, the largest increase in the number of deceptive practice offenses known to the police occurred in the suburban SMSA counties, where the number of incidents more than tripled in the ten year period, from 70 to over 300 a year (figures 32 and 33). The increase was especially great between 1979 (about 120) and 1980 (over 300). Large increases also occurred in the urban non-SMSA counties, where, after a low of about 450 in 1973, deceptive practice offenses numbered 1,400 by 1981. In the urban SMSA counties, deceptive practices also increased rapidly, from about 2,900 in 1972 to over 7,200 by 1981. In Cook County outside of Chicago, offenses known to the police increased steadily from about 1,900 in 1972 to over 3,500 in 1980, but declined slightly in 1981.

On the other hand, deceptive practice offenses increased very little in rural counties. They hovered between 600 and 900 during the period, with the exception of two peaks over 1,000 in 1978 and 1980.

In each of the ten years, over half of the forgery offenses known to the police in Illinois, except Chicago, occurred in the urban SMSA counties (figures 34 and 35). The number increased steadily from 1972 to 1979, from about 1,300 to 2,700 a year, but decreased to just over 2,400 by 1981.

Forgery offenses in the suburban SMSA counties also more than doubled between 1972 and 1981, from 50 to 113 annually. The same was true for the urban non-SMSA counties--after a low of about 150 in 1973, forgery offenses known to the police increased to nearly 400 in 1980 and 1981. Because forgery offense figures are not available for Chicago, the number of Cook County forgery offenses is low. Between 1972 and 1981, forgeries increased, with a low in 1973.

The largest increase in forgery offenses occurred in the rural counties. After a low under 190 in 1973, forgeries more than tripled to over 700 by 1980. There was a fairly sharp decline, however, in 1981, to 554.

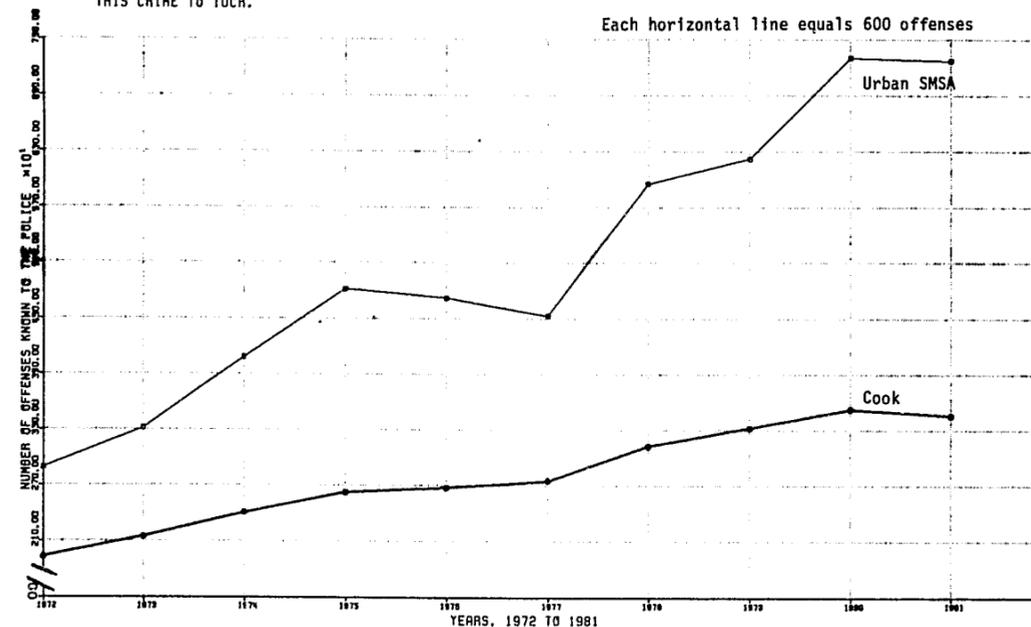

Vandalism offenses known to the police generally increased from 1972 to 1979 in each of the urban-rural county groups, and then decreased in 1980 and 1981 (figures 36 and 37). In the rural counties as a whole, the number rose from 5,000 in 1972 to almost 20,000 in 1980. The urban non-SMSA counties increased from about 2,050 in 1972 to almost 8,600 in 1979. The number of vandalism offenses also doubled in the other county groups, but the increase was smallest in Cook County outside of Chicago.

ROBBERY AND AGGRAVATED ASSAULT COMPARED

Frequency of Offenses

Robbery and aggravated assault are, by far, the most common violent Index crimes. However, the urban and rural areas have very different proportions of the two crimes. In Cook County, the robbery rate is much higher than the aggravated assault rate (figure 38). There are about one and a half robberies to every assault known to the police.²⁹ In contrast, the urban counties (both SMSA and non-SMSA) have two to three aggravated assault offenses for every robbery, and the rural and suburban county groups have four to five.

Robbery tends to be an urban crime. The robbery rate is higher in Cook County than in the other urban counties, and higher in the urban counties than in the suburban and rural counties. In contrast, aggravated assault is not predominately urban. Although the aggravated assault rate is lower in the rural and suburban areas than in the urban areas, the urban-rural difference is not as great as for robbery. Cook County's robbery rate is much higher than the rate in the other urban counties, but the aggravated assault rate is not.

Therefore, robbery is the more frequent violent crime in Cook County, but aggravated assault is the more frequent violent crime in the other urban counties. In the suburban and rural counties, aggravated assault contributes much more than robbery to the violent crime rate.

Patterns of Change Over Time

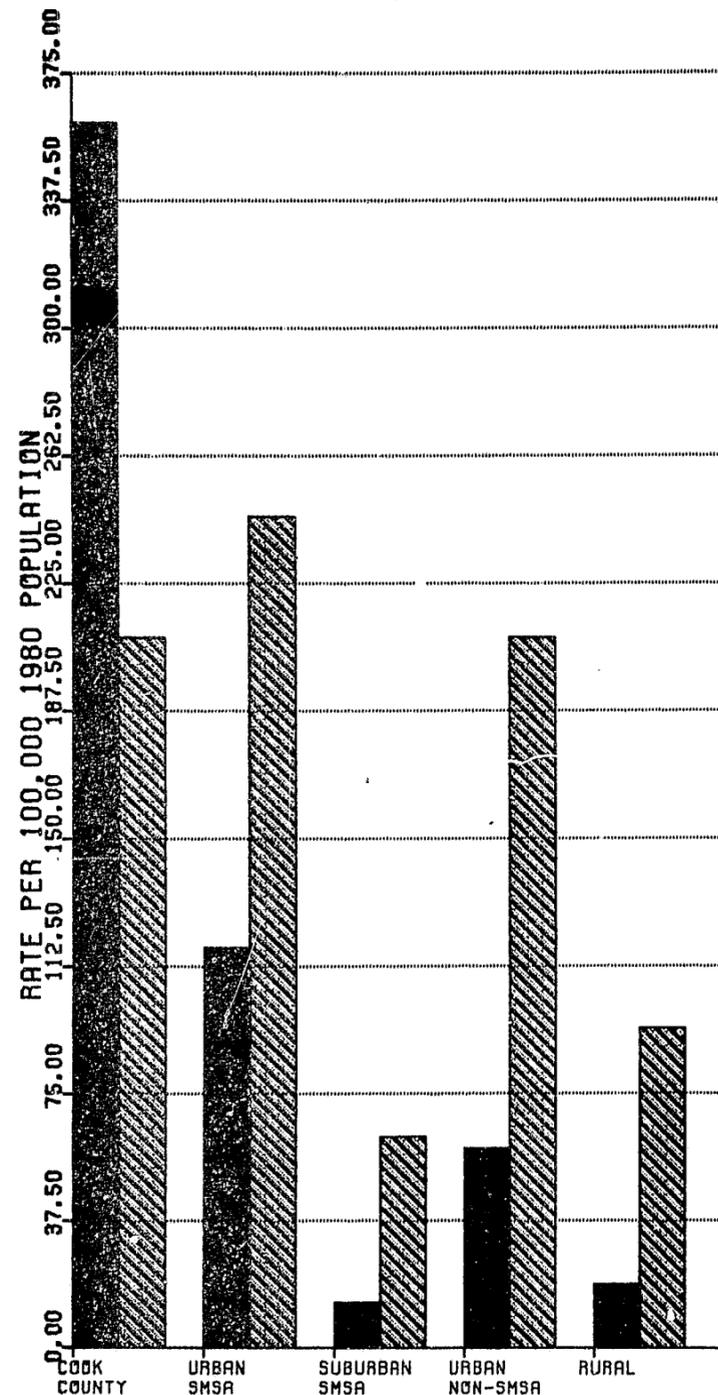

If robbery predominates in Cook County, but aggravated assault offenses predominate in the other counties, we might expect that the rural and urban county groups also differ in the pattern of change over time of robbery and assault. This section compares the monthly patterns of robbery and aggravated assault over the ten year period within each of the five county groups.³⁰

²⁹Over the ten year period, the number of Index robbery offenses was one and a half times the number of Index aggravated assault offenses in Cook County. See the appendix for 1981 rates for each crime in each county group.

³⁰According to the Census X-11 tests for the presence of seasonality (see note 13 above), Index aggravated assault in Illinois as a whole is definitely seasonal, and Index robbery is slightly seasonal. The five rural-urban county groups, however, differ greatly in the presence and the degree of seasonality in these two crimes. In general, aggravated assault and robbery have greater seasonal fluctuations in the more urban counties, especially Cook County and the urban SMSA counties. The other county groups have little or no significant seasonal fluctuation. The complete analysis of seasonality is too lengthy to include in this report. For the details of the analysis, please contact the authors.

 CENSUS, 1980 DATA.
 RATES ARE NUMBER OF OFFENSES KNOWN TO THE
 POLICE PER 100,000 POPULATION.

ROBBERIES

ASSAULTS

Rural Counties

In the rural counties, the number of Index robberies per month remained fairly steady throughout the ten year period, but the number of aggravated assaults increased sharply from mid-1976 through mid-1980 (figures 39 and 40). After 1974, robberies fluctuated around thirty a month, while aggravated assaults increased from about 85 a month in 1976 to more than 150 a month in 1980.

Urban non-SMSA Counties

Both Index robbery and aggravated assault offenses increased in the urban non-SMSA counties, as a group, from 1972 through 1974 (figures 41 and 42). Robbery increased from about ten to about thirty per month, and aggravated assault doubled from about thirty to about sixty.

After 1974, however, the patterns of robbery and assault diverged. Robbery declined to about twenty a month, and stayed at that level until 1981. In the meantime, aggravated assault continued to increase. In mid-1978, there were almost ninety Index aggravated assault offenses in a typical month. Around this typical number, there was some seasonal fluctuation.³¹ After 1978, assault offenses declined, until there were about seventy in a typical month.

Suburban SMSA Counties

Index robbery in the suburban SMSA group, as in the rural county group, stayed at a steady level, while Index aggravated assault fluctuated (figures 43 and 44). Despite this fluctuation, however, the number of aggravated assaults in a typical month in 1981 was not much different from the typical number in 1972. In 1972, there were six or seven offenses a month, and by the end of 1981, there were thirteen or fourteen. The number of robberies per month was three or four during the entire ten years.

Urban SMSA Counties

The robbery and aggravated assault patterns over time in the urban SMSA counties (figures 45 and 46) differ in two ways from the patterns in the suburban and non-SMSA counties.

First, both Index robbery and aggravated assault offenses show significant seasonal fluctuation in the urban SMSA counties,³² although they do not in the non-SMSA or suburban SMSA counties.³²

³¹There is more seasonality in this graph after 1974 than before, making the graph as a whole only marginally seasonal.

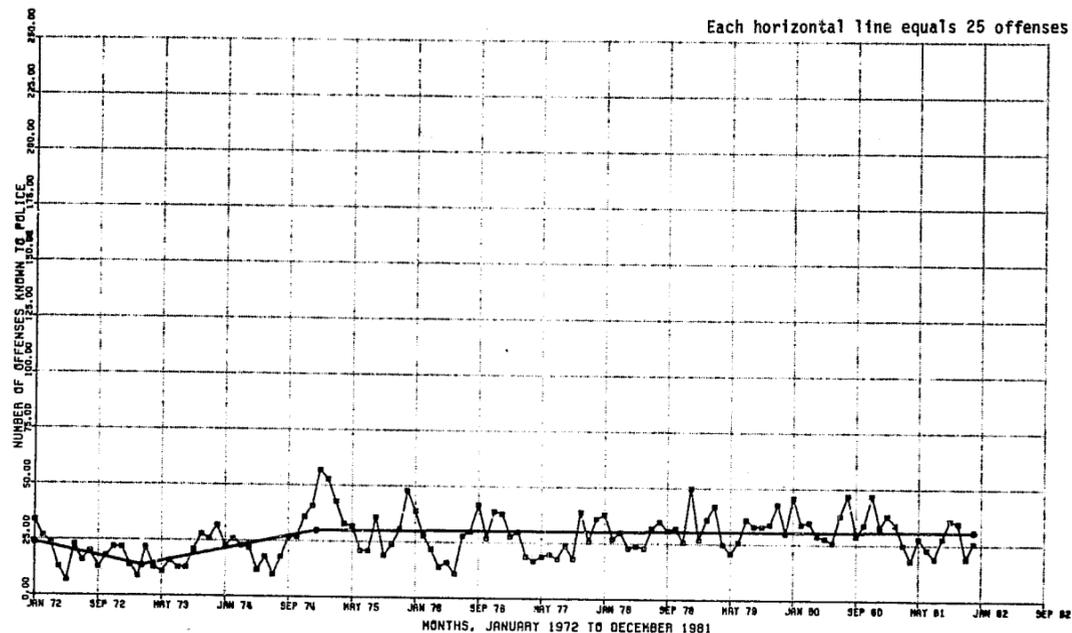

³²See notes 30 and 31, above.

Second, the pattern over time of Index robbery was similar to the pattern over time of Index aggravated assault. This is the only county group for which this is true. In the urban SMSA counties, as a group, the number of robberies and the number of aggravated assaults in a typical month increased in the early years, decreased, then increased until 1981. Index robbery doubled from about 240 offenses per month at the beginning of 1972 to almost 500 at the end of 1974, while the typical number of aggravated assault offenses rose from a little over 500 in 1972 to a little over 900 in mid-1973. Although the two patterns are similar, they are not exactly the same, however. For example, the number of aggravated assaults began to decrease in late 1973, while the number of robberies did not begin to decline until the end of 1974.

On the other hand, the urban SMSA robbery pattern is very similar to the urban non-SMSA robbery pattern. Robbery in these two groups of urban counties increased rapidly, decreased, and then changed very little (SMSA counties) or not at all (non-SMSA counties). This particular robbery pattern was confined to counties with medium-sized cities (25,000 and over population). In contrast, robberies in rural and suburban counties, as a whole, neither increased nor decreased, and, as the following analysis shows, robbery in Cook County fell rapidly during the same period as it remained level in the urban SMSA and non-SMSA counties.

Cook County

In contrast to the other county groups, Cook County usually had more Index robbery offenses than Index aggravated assault offenses in a given month (figures 47 and 48). Also, aggravated assault in Cook County fluctuates much more with the seasons than aggravated assault in any other county group. Robbery, on the other hand, is only slightly seasonal in Cook County. Unlike robbery and assault in the urban SMSA counties, in Cook County, the pattern of robbery over the ten year period is not similar to the pattern of aggravated assaults.

In the early years, the robbery pattern in Cook County was similar to the robbery patterns in the other two urban county groups (SMSA and non-SMSA). Robbery in Cook County increased from about 2,000 in a typical month of 1972 to over 2,300 at the end of 1974. The months from September to October, 1974, had extremely high numbers of robbery offenses. There were more than 3,500 in September. These extreme months in Cook County largely account for the extreme months in the total Illinois pattern (figure 5), although the other urban counties also contributed to the large number of robberies (see figures 41 and 45). Neither the rural nor the suburban county groups had extremely high numbers of robberies in these months.

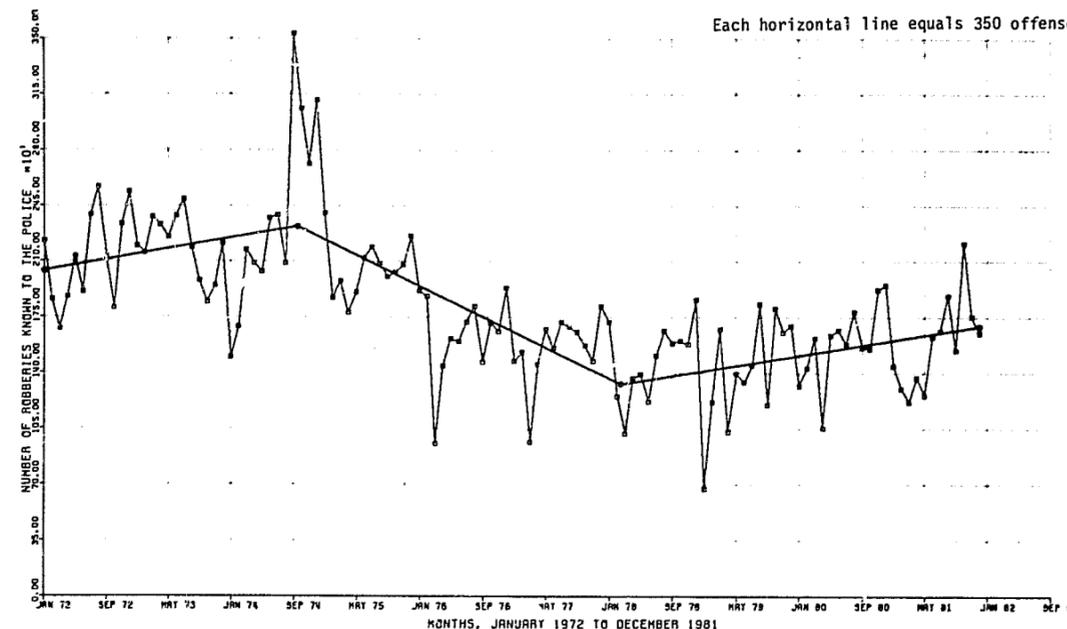

Unlike the other urban county groups, robbery in Cook County fell rapidly after 1974, dropping to under 1,350 at the beginning of 1978. Then, instead of remaining steady, it rose to about 1,700 by the end of 1981.

STATISTICAL ANALYSIS CENTER GRAPH

The pattern of Index aggravated assault offenses in Cook County differed from the pattern of Index robbery and also from the pattern of aggravated assault in the other county groups. Aggravated assault offenses generally decreased in Cook County throughout the ten year period. With seasonal fluctuations, the number was about 1,400 at the beginning of 1972, and fell to about 1,100 by 1978. Although it rose slightly from 1978 to 1980, it fell again in 1981, to a new low of about 800 a month.

CONCLUSIONS

This report describes patterns of change in crime in Illinois as a whole and within five groups of Illinois counties. This general description leaves many questions to be answered, but it provides the descriptive foundation necessary to answer those questions.

Many practical administrative decisions are made at the level of the individual jurisdiction. Just as the counties within each rural-urban group vary considerably, so, undoubtedly, do the jurisdictions within each county. The county and rural-urban descriptions give a useful overview of crime trends in Illinois, but future analysis should describe patterns within specific jurisdictions.

Not only do the patterns of jurisdictions vary within counties and county groups, but the patterns of specific crimes are not necessarily the same as the pattern of a general crime category. For example, Index robbery includes completed robberies and attempts. The pattern of change over time of completed robberies may not be the same as the pattern of attempts. In general, more serious crimes may not follow the same pattern as less serious crimes. Robbery with a gun may follow a different pattern than robbery with a knife or strongarm robbery.

Although the pattern descriptions in this report may suggest causal explanations, they cannot provide causal or predictive crime trend information. A police chief may want to predict the number of offenses so as to allocate resources efficiently. A prosecutor or the court may want to anticipate the caseload of serious crimes in a future month. A city council may want to know whether or not a crime control program actually reduced crime. Answering these questions requires explanatory research methods, not the simple pattern descriptions of this report. However, a simple description of the data is the first step in any explanation.

This report, then is a beginning. It lays a foundation for predictions and explanations of crime trends by describing the general pattern of change in Illinois crime over the ten years from 1972 through 1981. The next step is to build on this simple description by analyzing patterns of change in specific jurisdictions and specific crimes, and by investigating the causes of the patterns that this report has described.

APPENDIX

Crime Definitions¹

Index murder includes murder and voluntary manslaughter, which are the willful, non-negligent killing of one person by another. Thus, neither justifiable homicide nor involuntary manslaughter is included.

Index forcible rape includes rape and attempted rape, but not statutory rape or other sex offenses.

Index robbery includes robbery and attempted robbery. Robbery is the taking of property by force or threat of force.

Index aggravated assault includes aggravated assault, aggravated battery, and attempted murder. Aggravated assault is a threat to inflict serious bodily injury, while aggravated battery is the actual deed.

These four offenses--murder, forcible rape, robbery and aggravated assault--comprise the Index violent crime category. The four Index property crimes are burglary, larceny-theft, motor vehicle theft, and arson.

Index burglary includes forcible entry, unlawful entry with no force, and attempted forcible entry.

Index larceny-theft includes theft, burglary from a motor vehicle, and attempts to commit these crimes. Theft involves stealing property without force, violence or fraud, and does not include deceptive practices, such as embezzlement, "con" games, forgery, or passing worthless checks.

Index motor vehicle theft includes stealing and attempted stealing of automobiles, trucks, and other motor vehicles.

Index arson includes willful or malicious burning of a building or personal property, and attempts.

Many crimes involve a second included offense. For example, a murder may also be an aggravated assault and a robbery. In the Crime Index, the Uniform Crime Reporting program counts such multiple offenses as only one Index crime, the most serious. For example, a murder-robbery would be counted as an Index murder. However, when Index arson was added to the Index crimes in 1980, this created a problem. If the single count rule were followed for Index arson, the definitions of the other Index crimes would not be consistent from 1972 through 1981. For example, assuming

¹For more detailed definitions of Illinois offenses, see Crime in Illinois, published by the Illinois Department of Law Enforcement.

that arson were considered to be more serious than burglary, an arson-burglary would have been counted as an Index burglary in 1979, but as an Index arson in 1980. Therefore, when arson offenses include another Index crime, they are counted twice, as Index arson and as the other Index crime.

Deceptive practice includes general deception, such as knowingly making a false statement for the purpose of selling property; deception on a bank, such as making a false statement to obtain credit; possession of stolen or fraudulently obtained checks; possession of implements of check fraud; and possession of a check identification card.²

Forgery includes such offenses as making or altering a document with intent to defraud. Neither deceptive practice nor forgery data are available for Chicago.

Vandalism includes criminal damage to property, criminal damage to a vehicle, criminal damage to state supported land, and criminal damage to fire fighting apparatus. It does not include trespassing. These data are not available for Chicago.

²This definition differs somewhat from the definition the SAC used previously in "Focus: Crime in Rural Illinois," which counted only the Department of Law Enforcement (DLE) subcategory "deceptive practices." The present analysis defines deceptive practice as the sum of three DLE subcategories, deceptive practices, fraud, and embezzlement. This sum corresponds to the deceptive practice section of the Illinois Revised Statutes, Chapter 38, Section 17-1.

County Population Group Definitions

This category system differs in two ways from the population category system used in earlier SAC publications, such as Focus: Crime in Rural Illinois. 1. The new category system has five categories instead of four. The urban category under the old system is now divided into two categories: urban SMSA and suburban SMSA. 2. The new category system is based on 1980 Census definitions and population, while the old system was based on 1970 figures. This resulted in the following changes: Kankakee, which was semi-rural, is now urban SMSA; Boone, Clinton, Menard, Monroe, and Woodford, which were rural, are now suburban SMSA; and Henry and McHenry, which were urban, are now suburban SMSA.

1. Cook County.

This is the only category that contains a single county. Cook contains Illinois' largest city, Chicago, which accounts for over thirty percent of the Index crimes reported in Illinois annually.

2. Urban Counties within an SMSA

Included here are all SMSA counties that have a city of at least 25,000. The 15 counties in this category are: Champaign, DuPage, Kane, Kankakee, Lake, McLean, Macon, Madison, Peoria, Rock Island, St Clair, Sangamon, Tazewell, Will and Winnebago. Kankakee County is an exception to the usual Census definition. It is a single-county SMSA, with a central city of less than 50,000 population. The Census Bureau decided that Kankakee meets the density, urban and growth criteria to be considered an SMSA. It is not included in the Chicago SMSA, because Kankakee County residents generally do not commute to the Chicago area.

3. Suburban Counties within an SMSA

The seven counties in this group are those SMSA counties that have no city over 25,000: Boone, Clinton, Henry, McHenry, Menard, Monroe and Woodford. The Census includes them in an SMSA, because a substantial percentage of their populations commute into the central city of an adjoining county. For example, many Boone County residents work in Winnebago County. Even though Boone County itself is a small county with no large urban centers, the Census Bureau included it in the Rockford SMSA.

4. Urban Counties not in an SMSA

This group includes six counties that are not in any SMSA, but have a city of over 25,000. The counties are: Adams, DeKalb, Jackson, Knox, Stephenson and Vermillion. Unlike Kankakee, these counties did not meet the Census criteria for metropolitan character, and the populations of these counties do not generally commute to big cities in other counties. For this reason, they are not included in any SMSA. For example, Vermillion county has a city over 25,000 (Danville), and borders a large SMSA county (Champaign), but Vermillion County residents generally work in their home county rather than commute into Champaign County. Also, two of the counties in this group--DeKalb and Jackson--have large state universities in their large cities. The Census Bureau recognizes the size of these cities, but because of the makeup of the population (large numbers of students), does not group these areas into urban SMSA's.

5. Rural Counties

The remaining 73 Illinois counties are in this group. These are all non-SMSA counties, with no city over 25,000. Although we term this group "Rural", it must be kept in mind that counties with cities up to 24,999 residents are included here. Also, rural does not imply that the main or only industry in these areas is farming, as mining is a large industry in some of these counties.

VIOLENT AND PROPERTY CRIME RATES IN EACH ILLINOIS COUNTY, 1981^a

The chart below contains the following information for each Illinois county: 1980 population, Index violent and Index property crime offenses in 1981, and the violent and property crime offense rate. The counties are ordered according to their rural/urban category, with rural counties first, followed, in order, by urban non-SMSA, suburban SMSA, urban SMSA, Cook, and total Illinois.
