#### INTRODUCTION

The Fall 1983 prison and inmate population forecast is a transition forecast between the current criminal justice system and the system as it is anticipated it will operate under the Sentencing Reform Act. Before discussing the findings and assumptions, this report provides a brief summary of Washington's criminal justice environment and an historica? overview.

This forecast does not presume to provide a prediction of the future, but rather it is a statement of what the future prison population will be, if the crime, demographic, and criminal justice system factors follow their projected paths. The assumptions in this forecast are based upon the historical behavior of these critical factors and the expert consensus of key criminal justice decision makers as to how these factors may change in the future. The decision makers who formulated input for the prison and inmate population forecast are members of the Governor's Interagency Criminal Justice Work Group and the Sentencing Guidelines Commission. The forecast is developed under the direction of the Governor's Interagency Criminal Justice Work Group.

The forecast estimates the <u>total inmate</u> population from which two subsets of that population are derived: prison and inmate work release populations.

<u>Inmate</u> population always refers to the total population of inmates both in prison and work release.

<u>Prison</u> population always refers to the institutional prison population exclusive of the inmate work release population. This is a calculated population value equal to 92 percent of the total inmate population.

<u>Inmate Work Release</u> population always refers to the population of inmates housed in work release facilities. This is a calculated population value equal to 8 percent of the total inmate population.

## SECTION 1

#### WASHINGTON STATE CRIMINAL JUSTICE SYSTEM ENVIRONMENT

Washington State correctional facilities are entering their eighth year of overcrowding with our prisons holding 6200<sup>1</sup> persons, which is 137 percent of rated capacity. There are approximately another 500 persons in inmate work release facilities. There has been long term stress on this state's prison system that is indicative of problems throughout the criminal justice system. The following facts are important in understanding Washington's criminal justice problems as they relate to national trends.

PRISONS ARE SEVERLY OVERCROWDED. On December 31, 1983, the prison population was 6,200 or 137 percent of rated capacity. Approximately another 500 inmates were on inmate work release.

ONLY THE 1983 EARLY RELEASE PROGRAM HAS KEPT THE PRISON POPULATION CLOSE TO EMERGENCY CAPACITY LEVELS. Between October 1982 and November 1983, 900 inmates were released from prison up to one year early.

WASHINGTON STATE'S PRISON OVERCROWDING PROBLEM IS NOT UNIQUE. Thirtyseven other states have prisons so severely overcrowded that they are under court order to remedy the situation.

WASHINGTON STATE IS NOT UNNECESSARILY TOUGH ON CRIMINALS. Washington State's criminal justice system is severely strained; however, one of the causes of the overcrowding does not appear to be an unrealistically high incarceration rate. This is in spite of the fact that Washington, like other Pacific Coast states, has a high crime rate. Washington state ranks nationally:

- o 7th for the relative size of the male population between the ages of 18 and 39, the age responsible for about 80 percent of serious crimes.
- 13th for total reported crime. Ó
- 15th for property crimes.
- 26th for violent crimes. 0
- 26th for imprisonment rate. 0

<sup>1</sup>December 31, 1983, Daily Population Report.

GIVEN THE CRIME RATE, WASHINGTON'S PER CAPITA SPENDING FOR CRIMINAL JUSTICE IS LOW. Nationally there is a strong relationship between the amount of crime in a state and per capita spending. For states with a crime rate similar to Washington's the average per capita spending is about \$110. The highest per capita spending for states similar to Washington is \$175. Washington's per capita spending for criminal justice services is about \$93.

0

0

0

0

expected.

THE SENTENCING REFORM ACT WILL BE IMPLEMENTED IN 1984. This law represents significant operational changes in the criminal justice system.

THE CRIMINAL JUSTICE SYSTEM IS IN A PERIOD OF GREAT UNCERTAINTY.

Crime rates decreased in 1981 and 1982, but arrest rates have remained at high levels.

Except for sex crimes, which continue to increase, violent crime rates have deceased slightly.

Conviction rates for property and drug crimes are higher than

During past economic recoveries the state has experienced an increase in the crime rate.

## HISTORICAL OVERVIEW 1971 TO 1983

This section provides an historical perspective of the changes in the inmate population. The major contributors to inmate population are identified and discussed. These include crime rates, target population and the judicial decision to imprison  $(JDI)^1$ .

#### INMATE POPULATION WAS BELOW CAPACITY 1971-1975

- During this period the crime rate was increasing from 299 per ο thousand<sup>2</sup> in 1971 to 357 per thousand<sup>2</sup> in 1975.
- Between 1971 and 1975, the criminal target populations were also 0 growing; the target population for property crimes - males 18 to 24 years of age - increased 8 percent, while the target population for violent crimes - males 25 to 39 years of age - increased 18 percent.
- Increasing trends in population and crime were offset during this 0 period by a decreasing JDL. The total JDL fell from over 30 percent in the late 1960's to 17.8 percent in 1975, which resulted in the prison population being lower than the rated capacity.

#### 2. INCREASING INMATE POPULATION 1975-1979

- o Between 1975 and 1979 the crime rate actually decreased, declining to 313 per thousand<sup>2</sup> in 1977.
- Even though crime rates were decreasing during this period, crime 0 volumes were increasing due to a rapidly expanding target population. The population of 18 to 39 year old males increased 24 percent from 1975 to 1979, while the volume of crime increased 18 percent.
- In 1975, the JDI turned around and began to rise for the first time in 0 10 years reaching a peak of 23 percent in 1978. This was another factor causing the inmate population to exceed the rated institutional capacities.

<sup>1</sup>JDI measures the percentage of convicted persons that are sentenced to a prison term, as opposed to probation. <sup>2</sup>Per 1000 population of 18 to 39 year old males.

# 4.

5. INMATE POPULATION LESS THAN FORECAST 1983

forecast.

ο

.0

0

For most of FY 1983 an early release program was in effect. Between October 1982 and June 1983, 660 prisoners were released early causing the actual inmate population to fall below the forecast line.

If there had been no early release programs during FY 1983, the forecast would have underestimated the inmate population. Even with the early release program the prison population increased 453 in FY 1983 or 38 per month.

6000

4000

2000

1974 1977 1980 1971 \*Includes inmate work release

## 3. STABILIZING INMATE POPULATION 1980-1981

Because of overcrowded conditions in the state's prisons, the first early release programs began during this period.

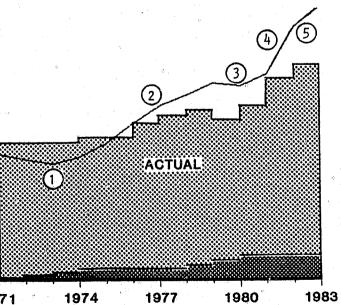

Also in response to overcrowding, by 1980 the JDI had dropped back to 1975 levels at 17.4 percent. Overcrowding was also relieved by holding sentenced felons destined for prison in county jails longer.

HISTORICALLY HIGH INMATE POPULATION INCREASES 1982

o During Fiscal Year 1982, there were no early release programs in effect, and the pool of eligible releasees was diminished by previous early release efforts. Consequently, there were about 500 fewer releases in FY 1982 than there had been in 1981.

During FY 1983, actual admissions to prison were only 39 more than

## SECTION II

#### FINDINGS

The Fall 1983 prison and inmate population forecast is a transition forecast between the criminal justice system as it operates now and the system as it will operate under the Sentencing Reform Act. The forecast for FY 1984 uses assumptions from the criminal justice system as it operates now. During the FY 1985 and 1986 forecasts, those assumptions were phased out, while assumptions for the Sentencing Reform Act were phased in and fully applied for 1987 and beyond. Because this is a transition forecast that reflects system changes, comparative information between the current system forecast and the Sentencing Reform Act forecast (or "Guidelines Forecast") is provided. Findings are presented in the following order.

o <u>Annual Prison and Inmate Population Forecasts</u>

o Prison and Inmate Capacity Forecasts

o <u>Inmate Admission and Release Forecasts</u>

o <u>Monthly Prison and Inmate Population Forecast</u>

 $\langle \cdot \rangle$ 

## Annual Priscn and Inmate Population Forecasts

Table 1 and Chart 2 show the forecast of the inmate population in prison and work release facilities. Each of the Sentencing Guidelines forecast lines corresponds to one of three different points in the guidelines sentencing range. They are: (1) lowest sentence lengths at the bottom of the sentencing range, (2) midpoint sentence lengths at 50 percent of the sentencing range, and (3) 25 percent of the sentencing range. 'Sentencing range' referred to here is the range of sentence lengths from which the judiciary may select under the Sentencing Reform Act. For example, 25 percent of the sentencing range refers to sentence lengths that are the minimum length plus 25 percent of the difference between the minimum and the maximum sentence lengths. The 25 percent forecast has been selected by the Work Group as the official inmate population forecast. It is shown on Chart 2 bounded by the low and midpoint forecasts.

Prison, Inmate Work Release, and Total Inmate Capacity Forecasts

Inmates are housed in either prisons and camps or at inmate work release facilities. This section presents, first, the current capacity and population of each prison institution and each inmate work release facility. Next, annual historical and forecast capacities are shown in comparison to prison and inmate work release populations.

Table 2a lists, by facility, the capacity and population of each prison and inmate work release facility at the end of December, 1983.

<sup>1</sup>December 31, 1983 <sup>2</sup>January 2, 1984 <sup>3</sup>Work Release capacity includes both inmate and parolepand probation capacity. Specific inmate capacity is not identified.

Chart 3a shows historical and forecast prison capacities and populations. The prison population shown is calculated by 92 percent of the inmate population.

## Prison and Inmate Capacity Forecasts

Chart 3b shows the guidelines and the current forecasts compared to the combined estimated prison and work release capacity plans. The inmate population under the guidelines assumptions is expected to fall below the emergency capacity after FY 1986 until FY 1994. Yet, even at its lowest point in 1988, the inmate population remains 665 above the rated capacity. Table 2b, below, shows the history and the forecast of inmate capacities.

# TABLE 2bRATED, EMERGENCY AND INMATE WORK RELEASE CAPACITIESSTATE OF WASHINGTON: 1971-1987

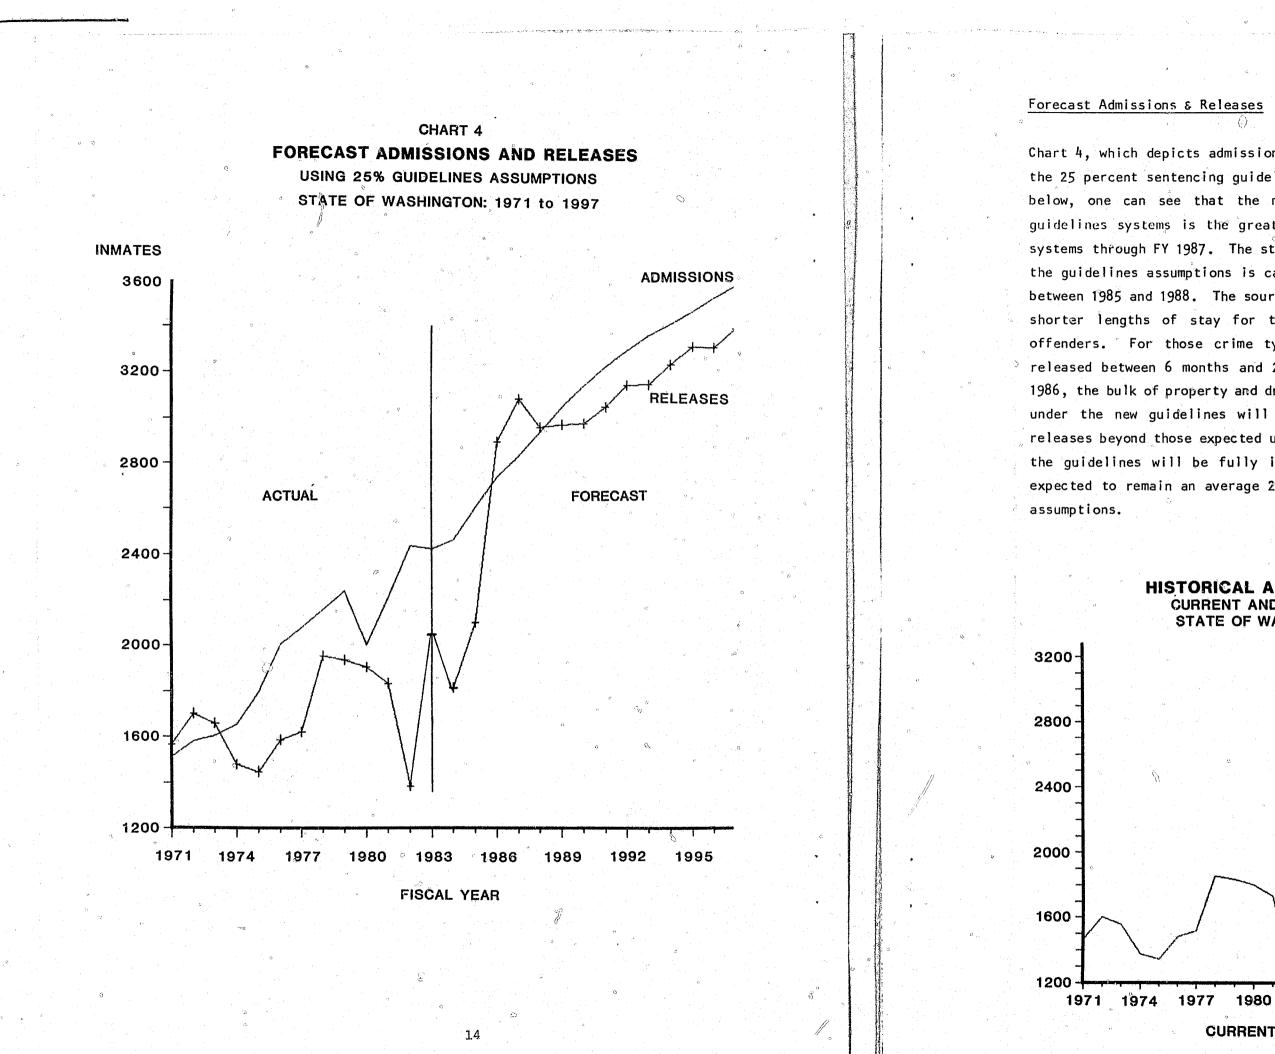

Chart 4, which depicts admissions and releases, is for the forecast using the 25 percent sentencing guidelines assumtions. By referring to Chart 5 below, one can see that the major difference between the current and guidelines systems is the greater number of releases for the guidelines systems through FY 1987. The stabilization of the inmate population under the guidelines assumptions is caused by an accelerated number of releases between 1985 and 1988. The source of the greater number of releases is the shorter lengths of stay for the high volume property and drug crime offenders. For those crime types 98 percent of the offenders will be released between 6 months and 24 months. So, between mid 1984 and mid 1986, the bulk of property and drug offenders that were initially sentenced under the new guidelines will be released, causing an acceleration of releases beyond those expected under the current assumptions. After 1987, the guidelines will be fully in effect, and the number of releases is expected to remain an average 205 higher than expected under the current

## CHART 5 HISTORICAL AND FORECAST RELEASES CURRENT AND GUIDELINES ASSUMPTIONS STATE OF WASHINGTON: 1971 to 1997

1983 1986 1989 1992 1995 CURRENT GUIDELINES+--+

Charts 6 and 7 and Table 3 show two changes to the current system resulting from the implementation of the sentencing guidelines. While new admissions are expected to rise somewhat under the guidelines, recidivist admissions are expected to decrease. The Parole Board will be phased out, so all future recidivists will be processed via the courts. Recently about 50 percent of recidivists have re-entered prison via the Parole Board. New assumptions in the guidelines forecast regarding the anticipated reduction in the number of technical violators recidivating is expected to cause a 19 percent reduction in recidivist admissions.

After FY 1988 releases under the guidelines assumptions will begin to stabilize, parallelling the pattern of releases for the current assumptions. By that time, releases for guidelines assumptions will have reached the new operational plateau. Then releases will become balanced between the rapid turnover of property and drug crime offenders, and violent offenders who are staying longer. Table 4 lists the forecast of admissions and releases for both the current and guidelines system.

<sup>1</sup>Includes escape differential of +48 during 1984.

۹. ,

Tables 5 and 6 show a detailed breakdown of forecast inmate populations through the end of the biennium. Forecast new admissions, recidivists, releases, and inmate population for males and females are listed by month.

At the bottom of the tables, the forecast prison and inmate work release populations are shown separately. These are calculated respectively by 92 percent and 8 percent of the total inmate population. Also included is the addition of four escape returnees per month for the first year. This anticipates the recent trend of more escapees returning to prison than inmates escaping.

18

## SECTION III ASSUMPTIONS AND FORECAST CHANGES

The assumptions established by the Governor's Interagency Criminal Justice Work Group for the Fall 1983 inmate forecast are based on the phase out of the current criminal justice system and the phase in of the Sentencing Reform Act. Accordingly, the assumption updates are based on two sources. The update of assumptions for the current criminal justice system are based on the monitoring report of the Fall 1982 forecast (Special Report <u>77</u>) and criminal justice background information provided in Special Report <u>76</u>. The assumptions regarding the implementation of the Sentencing Reform Act are based on the information provided by the Sentencing Guidelines Commission.

Within the past year, significant changes affecting the criminal justice system have occured. Those changes and the assumptions made to reflect them in this year's forecast are presented in this section. Each factor that directly or indirectly affects the inmate forecast is discussed in the order that it affects the criminal justice system. For those factors affected by the Sentencing Guidelines Commission's assumptions, a comparison showing the difference between the current and the guidelines assumption is presented. The order of the forecast factors are:

o CRIME, ARREST, FELONY FILING RATES

o CONVICTION RATES

o JUDICIAL DECISION TO IMPRISON (JDI)

o LENGTH OF STAY/RELEASES

o RECIDIVISM RATES

## Crime, Arrest, and Felony Filings

## O CRIME RATES WILL BEGIN TO INCREASE

As background for its consideration of conviction rates, the Work Group examined crime, arrest and felony filing patterns.

Table 7 shows that the reported crime rate<sup>1</sup>, and thus also reported crime volume, has decreased since calendar year (CY) 1980. The violent crime rate has declined from a high of 24.0 in CY 1980 to 21.3 in CY 1982. The property crime rate (excluding larceny) has declined from 116.1 in CY 1980 to 101.9 in CY 1982.

The assumption adopted by the Work Group is that this trend will <u>not</u> continue. Rather, it is expected that the crime rate decrease has run its course and that future crime rates will show a <u>gradual increase</u>.

The rational behind this assumption is based the forecast of an improved economic situation for Washington State and a forecast of increasing migration into the state resulting from that improved situation. It is forecast there will be a mid-range in-migration of 20,000 to 40,000 persons per year for the next five years. Since the 1960's, the crime rate in Washington has increased each time the economy has rebounded from a recession.

in spite of the decrease in crime rates in CY 1981 and CY 1982, arrest and felony conviction rates were stable or, for some crime types, increasing. While the volume of crime dropped dramatically after 1980 the volume of arrests actually <u>increased</u>. For example, over the 1981-1982 period there was a net decrease in violent crime volumes of 7.3 percent while arrests for those crimes over the same period increased 7.2 percent. Felony filings and convictions also increased during that period. Table 7, also shows a recent history of arrests, felony filings, and convictions. It can be seen that felony filings and convictions have increased steadily.

<sup>1</sup>Crime rates are expressed in terms of the number of reported crimes per 1,000 males age 18 to 39.

## Conviction Rates

O CONVICTION RATES WILL INCREASE GRADUALLY FOR ABOUT FOUR YEARS

The forecast cannot directly take into account the changing crime rate. Instead assumptions about the crime rate are made by changing the conviction rates in the computer input to the forecast. Conviction rates are a summary measure of the combined effects of the crime, arrest, and felony filing rates. Conviction rates in the forecast are the number of felony convictions per 1,000 males 16 to 54 years of age.

Because of recent experience and the assumption that the crime rate will begin to increase again, the Work Group assumed that felony conviction rates will continue to increase gradually during the next four to five years. Table 8 on the next page shows historical conviction rates and conviction rates for the current forecast. Appendix 1 lists the rationale for all changes to the conviction rates.

⊙*≈* 

 $\bigcirc$ 

Conviction rates for the guidelines forecast are calculated by 98.2 percent of current assumption rates. The reason the guidelines assumptions reduce current conviction rates by about 2 percent is because it is anticipated that only about 80 percent of the felony probation revocations will be reconvicted of a new felony.

## Conviction Rates -- Special Issue

SIGNIFICANT CHANGES ARE OCCURING IN THE AGE OF PERSONS CONVICTED FOR SEX CRIMES, DRUG CRIMES AND PROPERTY CRIMES

Males 18 to 24 years old and males 25 to 39 years old are two subpopulations frequently used to analyze criminal population. If there is a change in which age group typically commits a given crime, there will also be a change in the volume of that crime, because each age group is a different size and is forecasted to grow at a different rate. Chart 8 below shows how the size of each group is changing in relation to the other. Specifically, the older age group is changing in relation to the other. Specifically, the older age group continues to increase while the younger group has stabilized. Because of observed changes in the age structure of sex, drug, and property crimes, the Work Group developed assumptions about conviction rates that were specifically tailored to those three crimes. CHART 8

## CORRECTIONS TARGET POPULATIONS

	18 to 24		25	to 39	40 to 54		
	Volume	Rate <sup>2</sup>	Volume	Rate <sup>2</sup>	Volume	Rate <sup>2</sup>	
1977	127	.496	155	.375	77	.274	
1978	119	.448	155	.348	103	.360	
1979	113	.410	208	.433	97	.330	
1980	130	.456	234	.455	140	.462	
1981	137	.478	303	.560	170	.546	
1982	168	.598	366	.658	247	.781	
1983	156	.572	408	.723	271	.838	

rates.

<sup>1</sup>Excluding recidivists. <sup>2</sup>Rate equals the number of convictions per 1,000 of the identified at risk group.

SEX CRIMES are more frequently being committed by "older males", men over 25 years of age. Table 9 below shows the number and conviction rate for sex offenders for each age group.

#### TABLE 9 CONVICTION RATES FOR SEX CRIMES<sup>1</sup> MALES ONLY STATE OF WASHINGTON: 1977-1983

The age groups of 25 to 39 and 40 to 54 year old males are growing more rapidly than the younger age group. Consequently, the shift in the age of persons committing sex crimes from younger to older males can be expected to increase the volume of sex crimes.

The increasing conviction of older males for sex crimes may be due to increased awareness about sex crimes against minors, including rape, incest, and indecent liberties.

Because of the shifting age structure of sex crimes the Work Group forecasted a series of conviction rates for three age groups of sex offenders: 18 to 24, 25 to 39 and 40 to 54 year olds. Each group was assigned increasing conviction rates through 1987, with the older males increasing fastest. Table 10 shows the forecast for sex crime conviction

#### TABLE 10 FORECAST CONVICTION RATES MALE SEX CRIMES<sup>2</sup> **AY COMPONENT AGE GROUPS** STATE OF WASHINGTON: 1984-1987

18 to 24	25 to 39	40 to 54
.600	<u>25 to 39</u> .758	.894
.628	.793	.950
.657	.828	1.000
.684	.863	1.062

<u>DRUG CRIMES</u> have shown an even more dramatic change than have sex crimes. The involvement of older males is increasing and the involvement of younger males is leveling off. See Table 11. Drug convictions for 18 to 24 year old males had dropped steadily through the 1970's and have increased only gradually in the 1980's Drug conviction rates for older males are increasing at a much faster rate than the younger males in the 1980's. These data suggest that drug involvement of youth has stabilized but that those who were involved with drugs during the 1970's have continued their involvement as they have grown older.

1982	426	1.515	564	.646
1983	445	1.631	745	.840

<sup>1</sup>Excludes recidivists.

<sup>2</sup>Rate equals the number of convictions per 1,000 of the identified at risk group.

The Work Group forecasts an increase in the drug conviction rate for older males to last for 6 years, from .840 in 1983 to 1.010 in 1989. Younger males are forecast to increase at a slower rate to 1.730 by 1987.

Increasing law enforcement resources are being applied to drug crimes. Much of that increase is going toward efforts to apprehend drug dealers. This is the rationale for the forecasted increase of conviction rates for older males. The younger age group shows a leveling of drug conviction rates, corresponding to the forecast of only mildly increasing conviction rates. <u>PROPERTY CRIME</u> felony convictions had been expected to decrease as the number of males entering the 18 to 20 year old age group declined. Younger males are conventionally targeted as that group mainly responsible for property crimes. Instead, the conviction rate has increased for that age group. Table 12 below shows that the population of 18 to 20 year old males has decreased, while property convictions for that age group have increased.

<sup>1</sup>Does not include recidivists <sup>2</sup>Rate equals the number of convictions per 1,000 of 18 to 20 year old males.

The Work Group has forecast a slight increase in total property conviction rates for ages 18 to 20, from 15.23 in 1983 to 15.99 in 1986. After that time, the rate is forecast to stabilize.

#### TABLE 12

110,678	1,686	15.23

#### Judicial Decision to Imprison (JDI)

DUNDER SENTENCING REFORM ACT JDIS, WILL INCREASE FOR MOST VIOLENT CRIMES AND DECLINE FOR PROPERTY CRIMES

Judicial Decision to Imprison (JDI) percentages measure the percentage of newly convicted persons who are sentenced to a prison term, rather than to probation or community supervision, jail, or other community alternatives. The JDI does not include recidivists. Recidivists by definition have a 100 percent JDI.

The JDI can change rapidly, and, by doing so, have a significant effect on new prison admissions. Last year's forecast overestimated the JDI somewhat. The Work Group has forecast this year's JDI to be lower for robbery, assault, and property crimes based on the analysis of last year's forecast and historical trends. Table 13 compares the Fall 1982 and Fall 1983 JDI's.

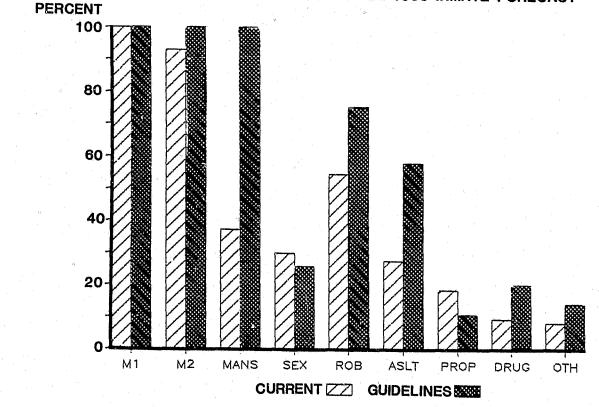

## TABLE 13 JUDICIAL DECISION TO IMPRISON FALL 1982 AND FALL 1983 FORECASTS

Crime Type	Fall 1982	Male Fall 1983	<u>Diff.</u>	Fall 1982	Female Fall <u>1983</u>	<u>Diff.</u>
Murder 1 Murder 2	100.0 93.0	100.0 93.0	0.0	100.0 76.4	100.0	0.0
Manslaughter	33.1	37.2	4.1	27.2	28.0	0.6
Sex Crimes Robbery	29.8 57.7	29.8 54.4	0.0 -3.3	33.1 47.8	33.1 46.4	0.0
Assault Property	31.2 20.7	27.5 18.5	-3.7	25.5	25.0 6.8	-0.5
Drug Crimes	9.4	9.5	0.1	9.6	6.7	-2.9
Other Crimes	5.1	8.3	3.2	3.9	6.4	2,5

Table 14 and Chart 9 show changes made to the JDI by the guidelines assumptions. Significant changes have been made to manslaughter, robbery, and assault, reflecting the intent of the guidelines to more frequently incarcerate violent offenders. The only crimes with a decreased JDI under the guidelines assumptions are property and sex crimes. The increase in the JDI for drug crimes reflects the intent to increase certainty of punishment for serious drug offenders.

## CHART 9

## FORECAST JUDICIAL DECISION TO IMPRISON

## CURRENT AND GUIDELINES ASSUMPTIONS STATE OF WASHINGTON: FALL 1983 INMATE FORECAST

#### Length of Stay--Releases

0

LENGTH OF STAY WILL DECREASE SIGNIFICANTLY FOR MOST CRIMES UNDER THE SENTENCING REFORM ACT

In the past, the most difficult factor to forecast has been inmate releases. In both the Fall 1981 and 1982 inmate forecasts, the greatest differences between actual and forecast values were in releases. In both cases releases were overestimated, thus producing an underestimation of the inmate population.

Recent study results have shown that on the average prisoners were released later than their assigned release dates due to loss of good time. Those are the dates used in the forecast programs to calculate releases. Based on this information, the programming was changed so that every tenth assigned release date was extended by six months. This applies only to persons already in prison. Release dates for forecast future admissions do not have any extra time added to them.

Prison overcrowding relief efforts frequently rely upon early release programs to reduce inmate populations. Washington State has employed early release programs in an ongoing effort to relieve overcrowding. Since October 1981 about 900 prisoners have been released between 3 months and 1 year early.

Last year, early release programs caused an underestimation of releases. Even though the early release program is scheduled to continue until Twin Rivers prison is opened in the Spring of 1984, no assumptions about early releases have been included in the Fall 1983 forecast. This is because the number of persons qualifying for early release has decreased due to the depletion of eligible releasees created by recent early release efforts. The uncertain future regarding early release programs is the reason assumptions including early releases are not used in the forecast. One method of limiting the inmate population is to release prisoners before their assigned release dates. Another method is to simply assign shorter sentences -- Length of Stay (LOS). This is the approach utilized by the sentencing guidelines. Table 15 shows how length of stays have been decreased under the assumptions of the sentencing guidelines.

#### Crime Type

Murder 1 Murder 2 Manslaughter Sex Crimes Robbery Assault Property Drug Crimes Other Crimes

It is important to realize that although the smallest decreases can be seen in property crimes and drug crimes, these are high volume crimes and produce a sizeable reduction of inmate population.

#### TABLE 15 FORECAST MEDIAN LENGTHS OF STAY CURRENT AND GUIDELINES ASSUMPTIONS

•
se

#### Recidivism

#### RECIDIVISM HAS INCREASED RECENTLY 0

IT IS ANTICIPATED THAT RECIDIVISM WILL DECLINE WITH THE IMPLE-Ó MENTATION OF THE SENTENCING REFORM ACT

One of the major changes introduced by the sentencing guidelines assumptions is to recidivism rates. The sentencing guideline assumptions anticipate a permanent reduction in the number of persons returning to prison following release. This reduction amounts to a 19 percent reduction in total recidivism.

Under the Sentencing Reform Act the Board of Prison Terms and Paroles will be phased out. As a result, all inmate recidivists must be convicted of a new felony before being readmitted to prison. The technical revocation procedures used to send a person who fails on parole or probation to prison will cease. The rationale for the reduction in the sentencing guidelines assumptions for recidivism is that 75 percent of the technical parole revocations and 65 percent of the technical probation revocations (presently a decision made by the judge) will not be convicted for a new felony under the Sentencing Reform Act. Table 16 below shows the current and guidelines forecast of recidivism.

#### SECTION IV

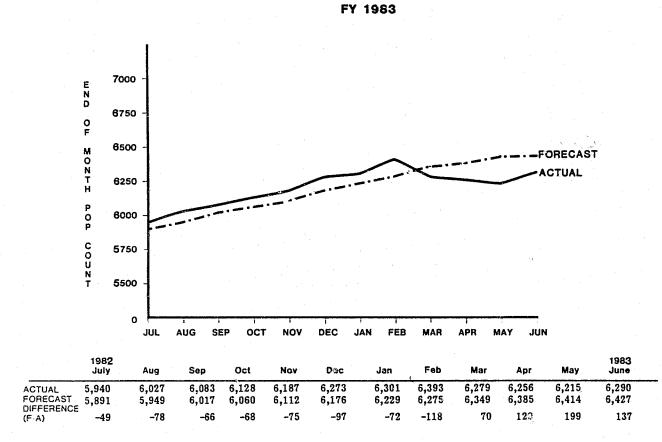

## SUMMARY OF MONITORING LAST YEAR'S FORECAST FALL 1982

A monitoring report of the Fall 1982 inmate population forecast (Special Report 77) has been published to present an analysis of all the components of change in the forecast. The following charts are a summary from that

Chart 10 shows the actual inmate population dropping below the forecast, an effect of early release efforts. Table 17 shows a summary of each component of the forecast: New admissions, recidivist admissions, and

Last year's forecast was within 1 percent of actual. To maintain this level of accuracy the assumptions and drivers for the inmate population forecast must be updated as frequently as possible, usually annually. The beginning of that process is monitoring the last forecast.
