Test Results for Hardware Write Block
Device: WiebeTech Bus Powered Forensic ComboDock (FireWire Interface)
This report was prepared for the National Institute of Justice, U.S. Department of Justice, by the Office of Law Enforcement Standards of the National Institute of Standards and Technology under Interagency Agreement 2003-IJ-R-029.

The National Institute of Justice is a component of the Office of Justice Programs, which also includes the Bureau of Justice Assistance, the Bureau of Justice Statistics, the Office of Juvenile Justice and Delinquency Prevention, and the Office for Victims of Crime.

Introduction

The Computer Forensics Tool Testing (CFTT) program is a joint project of the National Institute of Justice (NIJ), the research and development organization of the U.S. Department of Justice, and the National Institute of Standards and Technology’s (NIST’s) Office of Law Enforcement Standards (OLES) and Information Technology Laboratory (ITL). CFTT is supported by other organizations, including the Federal Bureau of Investigation, the U.S. Department of Defense Cyber Crime Center, Internal Revenue Service Criminal Investigation’s Electronic Crimes Program, and the U.S. Department of Homeland Security’s Bureau of Immigration and Customs Enforcement and U.S. Secret Service. The objective of the CFTT program is to provide measurable assurance to practitioners, researchers, and other applicable users that the tools used in computer forensics investigations provide accurate results. Accomplishing this requires the development of specifications and test methods for computer forensics tools and subsequent testing of specific tools against those specifications.

Test results provide the information necessary for developers to improve tools, users to make informed choices, and the legal community and others to understand the tools’ capabilities. This approach to testing computer forensic tools is based on well-recognized methodologies for conformance and quality testing. The specifications and test methods are posted on the CFTT Web site (http://www.cftt.nist.gov/) for review and comment by the computer forensics community.

This document reports the results from testing the WiebeTech Bus Powered Forensic ComboDock (FireWire Interface) write blocker, against the Hardware Write Blocker (HWB) Assertions and Test Plan Version 1.0, available at the CFTT Web site (http://www.cftt.nist.gov/HWB-ATP-19.pdf). This specification identifies the following top-level tool requirements:

- A hardware write block (HWB) device shall not transmit a command to a protected storage device that modifies the data on the storage device.
- An HWB device shall return the data requested by a read operation.
- An HWB device shall return without modification any access-significant information requested from the drive.
- Any error condition reported by the storage device to the HWB device shall be reported to the host.

Test results from other software packages and the CFTT tool methodology can be found on NIJ’s computer forensics tool testing Web page, http://www.ojp.usdoj.gov/nij/topics/ecrime/cftt.htm.
Test Results for Hardware Write Block Devices

Device Tested: WiebeTech Bus Powered Forensic ComboDock (FireWire Interface)
Model: FCD–BP
Serial No: 62601000226

Host to Blocker Interface: FireWire
Blocker to Drive Interface: IDE

Supplier: WiebeTech LLC
Address: WiebeTech LLC
8200 East 34th Street North #1404
Wichita, KS 67226
866–744–8722
http://www.wiebetech.com/

1 Results Summary by Requirements
An HWB device shall not transmit a command to a protected storage device that modifies the data on the storage device.
For all test cases run, the device always blocked any commands that would have changed user or operating system data stored on a protected drive.

An HWB device shall return the data requested by a read operation.
For all test cases run, the device always allowed commands to read the protected drive.

An HWB device shall return without modification any access-significant information requested from the drive.
For all test cases run, the device always returned access-significant information from the protected drive without modification.

Any error condition reported by the storage device to the HWB device shall be reported to the host.
For all test cases run, the device always returned error codes from the protected drive without modification.

2 Test Case Selection
Since a protocol analyzer was not available for the interface between the blocker and the protected drive, the following test cases were appropriate: HWB–02, HWB–04, HWB–05, HWB–07, HWB–08, and HWB–09.
For test case HWB–04, two variations were selected: file (attempt to use operating system commands to create and delete file system objects (files and directories) from a protected drive) and image (use an imaging tool to attempt to write to a protected drive).

For test case HWB–07, one variation was selected: ix (use a stand-alone imaging tool (IXimager) to read from a protected drive).

3 Testing Environment
The tests were run in the NIST CFTT lab. This section describes the hardware (test computers and hard drives) available for testing.

3.1 Test Computers
Three test computers were used: Chan, JohnStone and JohnSteed. Chan has the following configuration:

- Asus P4P8T Intel® (865G/ICH 5 chipsets, FSB 800/533/400MHz) Motherboard
- AMIBIOS© American Megatrends Asus P4P8T–SP ACPI BIOS revision 1003
- Intel® Pentium® 4 CPU
- Plextor DVDR PX–716A, ATAPI CD/DVD–ROM drive
- WDC WD800JB–00JJC0, 80 GB ATA disk drive
- Five IEEE 1394 ports
- Six USB ports
- Memory Card reader

JohnStone and JohnSteed have the following configuration:

- FIC IC–VL67 (865G; S478; 800MHz) Intel® Desktop Motherboard
- Phoenix-Award BIOS version v6.00PG
- Intel® Pentium® 4 CPU
- Plextor DVDR PX–716A, ATAPI CD/DVD–ROM drive
- WDC WD800JB–00JJC0, 80 GB ATA disk drive
- 1.44MB floppy drive
- Three IEEE 1394 ports
- Four USB ports

3.2 Protocol Analyzer
A Data Transit bus protocol analyzer (Bus Doctor Rx) was used to monitor and record commands sent from the host to the write blocker. Two identical protocol analyzers were available for monitoring commands.

One of two Dell laptop computers (either Chip or Dale) was connected to each protocol analyzer to record commands observed by the protocol analyzer.
### 3.3 Hard Disk Drives

The hard disk drives used in testing are described below.

<table>

- P primary partition (1–4)
- S secondary (sub) partition
- X primary extended partition (1–4)
- x secondary extended partition
### 3.4 Support Software

The software in the following table was used to send commands to the protected drive. One widely used imaging tool, IXimager, was used to generate disk activity (reads and writes) consistent with a realistic scenario of an accidental modification of an unprotected hard drive during a forensic examination. This does not imply an endorsement of the imaging tool.

<table>
<thead>
<tr>
<th>Program</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sendSCSI</td>
<td>A tool to send SCSI commands wrapped in the USB or IEEE 1394 (FireWire) protocols to a drive.</td>
</tr>
<tr>
<td>FS–TST</td>
<td>Software from the FS–TST tools was used to generate errors from the hard drive by trying to read beyond the end of the drive. The FS–TST software was also used to setup the hard drives and print partition tables and drive size.</td>
</tr>
<tr>
<td>IXimager</td>
<td>An imaging tool (ILook IXimager version 1.0, August 25, 2004) for test case 04-img.</td>
</tr>
</tbody>
</table>

### 4 Test Results

The main item of interest for interpreting the test results is determining the conformance of the device with the test assertions. Conformance with each assertion tested by a given test case is evaluated by examining the Blocker Input and Blocker Output boxes of the test report summary.

#### 4.1 Test Results Report Key

A summary of the actual test results is presented in this report. The following table presents a description of each section of the test report summary.

<table>
<thead>
<tr>
<th>Heading</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Line</td>
<td>Test case ID; name, model, and interface of device tested.</td>
</tr>
<tr>
<td>Case Summary</td>
<td>Test case summary from <em>Hardware Write Blocker (HWB) Assertions and Test Plan Version 1.0</em>.</td>
</tr>
<tr>
<td>Assertions Tested</td>
<td>The test assertions applicable to the test case, selected from <em>Hardware Write Blocker (HWB) Assertions and Test Plan Version 1.0</em>.</td>
</tr>
<tr>
<td>Tester Name</td>
<td>Name or initials of person executing test procedure.</td>
</tr>
<tr>
<td>Test Date</td>
<td>Time and date that test was started and completed.</td>
</tr>
</tbody>
</table>
| Test Configuration      | Identification of the following:  
  1. Host computer for executing the test case.  
  2. Laptop attached to each protocol analyzer.  
  4. Interface between host and blocker.  
  5. Interface between blocker and protected drive.  
  6. Execution environment for tool sending commands from the host. |
| Hard Drives Used       | Description of the protected hard drive. |
| Blocker Input          | A list of commands sent from the host to the blocker. |
For test case HWB–02 and HWB–07, a list of commands sent is provided.

For test cases HWB–02 and HWB–04, an SHA1 value for the entire drive is provided for reference.

For test case HWB–05, a string of known data from a given location is provided for reference.

Blocker Output

For test cases HWB–02, HWB–04, and HWB–07, an SHA1 value computed after commands are sent to the protected drive is given for comparison to the reference SHA1 value.

For test case HWB–05, a string read from a given location is provided for comparison to known data.

For test case HWB–08, the number of sectors determined for the protected drive and the partition table are provided.

For test case HWB–09, any error return obtained by trying to access a nonexistent sector of the drive is provided.

Results

Expected and actual results for each assertion tested.

Analysis

Whether or not the expected results were achieved.

4.2 Test Details

Test Case HWB-02 Variation hwb-02 WiebeTech Bus Powered ComboDock (FireWire)

Case Summary: HWB-02 Identify modifying commands blocked by the HWB.

Assertions Tested: HWB-AM-01 The HWB shall not transmit any modifying category operation to the protected storage device.

Tester Name: brl

Test Date: run start Wed Jan 11 12:38:21 2006
run finish Wed Jan 11 16:03:17 2006

Test Configuration:
HOST: JohnSteed

Test Case HWB-09 Variation hwb-09 WiebeTech Bus Powered ComboDock (FireWire)

Case Summary: HWB-09 Determine if an error on the protected drive is returned to the host.

Assertions Tested: HWB-AM-04 If the host sends an operation to the HWB and if the operation results in an unresolved error on the protected storage device, then the HWB shall return an error status code to the host.

Tester Name: brl
Test Date: run start Wed Jan 11 12:01:00 2006
run finish Wed Jan 11 12:02:55 2006

Test Configuration:
HOST: JohnSteed
HostToBlocker Monitor: none
HostToBlocker PA: none
HostToBlocker Interface: FW400

About the National Institute of Justice

NIJ is the research, development, and evaluation agency of the U.S. Department of Justice. NIJ's mission is to advance scientific research, development, and evaluation to enhance the administration of justice and public safety. NIJ's principal authorities are derived from the Omnibus Crime Control and Safe Streets Act of 1968, as amended (see 42 U.S.C. §§ 3721–3723).

The NIJ Director is appointed by the President and confirmed by the Senate. The Director establishes the Institute's objectives, guided by the priorities of the Office of Justice Programs, the U.S. Department of Justice, and the needs of the field. The Institute actively solicits the views of criminal justice and other professionals and researchers to inform its search for the knowledge and tools to guide policy and practice.

Strategic Goals

NIJ has seven strategic goals grouped into three categories:

Creating relevant knowledge and tools
1. Partner with State and local practitioners and policymakers to identify social science research and technology needs.
2. Create scientific, relevant, and reliable knowledge—with a particular emphasis on terrorism, violent crime, drugs and crime, cost-effectiveness, and community-based efforts—to enhance the administration of justice and public safety.
3. Develop affordable and effective tools and technologies to enhance the administration of justice and public safety.

Dissemination
4. Disseminate relevant knowledge and information to practitioners and policymakers in an understandable, timely, and concise manner.
5. Act as an honest broker to identify the information, tools, and technologies that respond to the needs of stakeholders.

Agency management
6. Practice fairness and openness in the research and development process.
7. Ensure professionalism, excellence, accountability, cost-effectiveness, and integrity in the management and conduct of NIJ activities and programs.

Program Areas

In addressing these strategic challenges, the Institute is involved in the following program areas: crime control and prevention, including policing; drugs and crime; justice systems and offender behavior, including corrections; violence and victimization; communications and information technologies; critical incident response; investigative and forensic sciences, including DNA; less-than-lethal technologies; officer protection; education and training technologies; testing and standards; technology assistance to law enforcement and corrections agencies; field testing of promising programs; and international crime control.

In addition to sponsoring research and development and technology assistance, NIJ evaluates programs, policies, and technologies. NIJ communicates its research and evaluation findings through conferences and print and electronic media.
