As the Nation moves into the 21st century, the reduction of juvenile crime, violence, and victimization constitutes one of the most crucial challenges of the new millennium. To meet that challenge, reliable information is essential. Juvenile Offenders and Victims: 1999 National Report offers a comprehensive overview of these pervasive problems and the response of the juvenile justice system. The National Report brings together statistics from a variety of sources on a wide array of topics, presenting the information in clear, nontechnical text enhanced by more than 350 easy-to-read tables, graphs, and maps.

This Bulletin series is designed to give readers quick, focused access to some of the most critical findings from the wealth of data in the National Report. Each Bulletin in the series highlights selected themes at the forefront of juvenile justice policymaking and extracts relevant National Report sections (including selected graphs and tables).

**Administrator’s Message**

When we hear the term “juvenile crime” or “youth violence,” we tend to think of juveniles primarily as offenders, not victims. This Bulletin, derived from Juvenile Offenders and Victims: 1999 National Report, documents the impact of crime on society’s most vulnerable victims—children.

Although the U.S. violent crime rate has decreased since 1994, homicide remains a leading cause of death for young people. In 1997 (the most recent year for which data were available for the Report), an average of six juveniles were murdered every day. Between 1980 and 1997, three of four murdered juveniles age 12 or older were killed with a firearm.

Juveniles are twice as likely as adults to be victims of serious violent crime and three times as likely to be victims of assault. Many of these victims are quite young. Law enforcement data indicate that 1 in 18 victims of violent crime is under age 12. In one-third of the sexual assaults reported to law enforcement, the victim is under age 12. In most cases involving serious violent crime, juvenile victims know the perpetrator, who is not the stereotypical “stranger,” but a family member or acquaintance.

In 1996, child protective services received reports on more than 3 million maltreated children. In 80 percent of these reported cases, the alleged perpetrator was the child’s parent. More than 1,000 children died as the result of maltreatment in 1996. Three in four of these victims were children under age 4.

Children with a history of maltreatment experience increased risk factors for delinquency. In addition, maltreatment and victimization can damage self-esteem, demolish families, and destroy futures. The statistics highlighted in this Bulletin should act as an urgent call to communities, schools, juvenile justice agencies, courts, families, and others to make combating crimes against children a priority.

John J. Wilson
Acting Administrator
Between 1980 and 1997, nearly 38,000 juveniles were murdered in the U.S.

The FBI maintains detailed records on murders in the U.S.

The Federal Bureau of Investigation's (FBI's) Uniform Crime Reporting Program asks local law enforcement agencies to provide detailed information on all homicides. These Supplementary Homicide Reports (SHRs) capture information on victim and offender demographics, the victim-offender relationship, the weapon used, and the circumstances surrounding the crime. The FBI estimates that 91% of all homicides committed in the U.S. between 1980 and 1997 were reported to the FBI.

The number of murders in 1997 was the lowest since 1971

Estimates from the SHR data show that murders peaked in 1991 with 24,700 victims, or a rate of nearly 10 murders for every 100,000 persons living in the U.S. While the number of murders was high, rates similar to the 1991 rate were experienced in other years since 1970 (e.g., 1974, 1979, 1980, 1981).

Between 1991 and 1997, the number of murders dropped 26%, to 18,200, or about 7 murders for every 100,000 persons living in the U.S. The number of murders had not been this low since 1971, and the murder rate had not been this low since 1968.

Murders of juveniles remain high

In the U.S., one of the leading causes of death for juveniles is homicide. In 1997, the National Center for Health Statistics listed homicide as the fourth leading cause of death for children ages 1 to 4, third for youth ages 5 to 14, and second for persons ages 15 to 24.
The number of juveniles murdered peaked in 1993 at 2,900, about 4 murders for every 100,000 persons under age 18 living in the U.S. By 1997, this figure had dropped to 2,100, or about 3 murders per 100,000 juveniles. Unlike the pattern of all murders, however, the number of juvenile murders in 1997 was still substantially above the levels of the mid-1980’s, when about 1,600 juveniles were murdered annually.

In 1997, about six juveniles were murdered daily.

Of all persons murdered in 1997, 11% were under the age of 18. Of these 2,100 juvenile murder victims in 1997:

- 33% were under age 6 and 50% were ages 15 through 17.
- 30% were female.
- 47% were black.
- 56% were killed with a firearm.
- 40% (among those whose murderers were identified) were killed by family members, 45% by acquaintances, and 15% by strangers.

The murders of younger and older juveniles had different characteristics. Compared with youth under age 12, older juvenile victims in 1997 were more likely to be male (81% vs. 55%) and black (53% vs. 39%). Family members killed a greater proportion of younger rather than older juvenile victims (70% vs. 10%). Offenders with firearms killed a larger proportion of older rather than younger juveniles (83% vs. 16%).

The large increase in overall juvenile homicides between 1986 and 1993 and subsequent decline were nearly all due to changes in the homicide of older juveniles.

In the 1980’s, males accounted for 62% of juvenile homicide victims; in the 1990’s, this proportion has averaged 71%.

Between 1980 and 1997, the annual number of juvenile females murdered has not differed substantially from the average of 700 per year.

The landscape of murder shows peaks for young adults killed by young adults and for infants killed by adults

A new view of murder

Some relationships can be summarized in 2-dimensional graphs; other relationships require a more complex picture. To provide a more comprehensive representation of murders, Michael Maltz proposed using 3-dimensional plots to show the relationship between the ages of victims and offenders. Such a plot is presented in the surface graph to the right.

The contours of its surface reveal some attributes of murder in the U.S. The large central peak shows that most offenders are between ages 18 and 34, as are their victims. The smaller peak off to the left shows that many very young children are killed by persons in their twenties and thirties—mostly incidents of infants being killed by their parents. There is an area between the two peaks in which very few murders occur (victim ages 4 to 12). The diagonal ridge running from the top of the central peak to the lower right-hand corner shows that adult offenders tend to kill victims in their own age group. The ridge running along the line of 20-year-old offenders shows that older juveniles and young adults kill victims in a wide age range.

One difficulty with the 3-dimensional representation is reading the coordinates of various features, due to the distortion caused by representing three dimensions in a 2-dimensional space. Another representation of the same murder data is a 2-dimensional plot that uses color to represent the number of murders in each victim-offender age pair.

Representing complex data visually can help a reader grasp the complex interrelationships often lost in more traditional data presentations.

At the point of greatest risk (the top of the highest peak), are 19- and 20-year-olds killing 19- and 20-year-olds.

Note: The age of the oldest offender is used in multiple-offender homicides. In this Bulletin, the 2-dimensional graphs use gradations of two colors; for full-color graphs, see pages 22 and 23 of Juvenile Offenders and Victims: 1999 National Report.

Source: Authors’ analyses of the FBI’s Supplementary Homicide Reports for the years 1980–1997 [machine-readable data files].
Females are at greatest risk of murder in their first year of life and in their young adult years

While the numbers of infant males and females murdered are similar, the risk of murder for males in young adulthood far surpasses that for young adult females.

Note: The age of the oldest offender is used in multiple-offender homicides. In this Bulletin, the 2-dimensional graphs use gradations of two colors; for full-color graphs, see pages 22 and 23 of Juvenile Offenders and Victims: 1999 National Report.

Juveniles ages 12–17 are as likely to be victims of serious violence as are young adults ages 18–24

Juveniles and young adults have the greatest risk of victimization

The National Crime Victimization Survey (NCVS) asks individuals whether they have been the victim of a crime, and from their responses generates victimization rates for various demographic groups. These rates reflect the number of victimizations reported per equivalent-size population units (e.g., aggravated assault victimizations per 1,000 persons ages 12–17).

In 1995 and 1996, victimization rates for serious violent crimes (i.e., rape, robbery, aggravated assault) varied substantially across age groups. Senior citizens had much lower victimization rates than young adults ages 18–24. In fact, within the adult population, these young adults had the highest victimization rates for rape, robbery, and aggravated assault.

The serious violent crime victimization rates for juveniles were roughly equivalent to those for young adults, while the simple assault victimization rate for juveniles was triple that for young adults. Overall, juveniles were at greater risk of violent victimizations in 1995 and 1996 than even the most victimized age group of adults.

Juvenile victims are likely to know their offender

In 1996, juveniles ages 12–17 who were the victims of a serious violent crime knew their offenders in 64% of these victimizations: 18% of victimizations involved an acquaintance, 34% a friend, and 11% a relative. In the other 36% of victimizations, the offender was a stranger. The offender was more likely to be known to the juvenile victim in simple and

Most serious violent juvenile victimizations (60%) involved only a single offender. Multiple offenders were more likely in juvenile robberies (46%) and aggravated assaults (41%) than in simple assaults (22%). Juveniles were injured in 74% of serious violent victimizations. Juveniles were more likely to be injured as the result of a robbery (61%) or aggravated assault (80%) than a simple assault (45%).

**Most victimizations of juveniles are not reported to police**

In 1996, about half (48%) of the serious violent victimizations of juveniles were not reported to police or any other authority (e.g., teachers, school principals). Victims reported 33% of serious violent victimizations directly to police; victims reported 19% to some other authority, and about one-third of these incidents were subsequently reported to law enforcement. Therefore, law enforcement eventually learned of about 4 of every 10 serious violent juvenile victimizations, including about 25% of simple assaults, 40% of aggravated assaults, and 44% of robberies. Juvenile victims in 36% of robberies, 50% of aggravated assaults, and 52% of simple assaults never reported the incident to either police or other officials.

**In 1995 and 1996, victims were ages 12–17 in 1 in 5 serious violent crime victimizations**

"Much of what is known about the victimization of juveniles comes from NCVS"

The Bureau of Justice Statistics (BJS) conducts the National Crime Victimization Survey (NCVS). With funds from BJS, the Bureau of the Census contacts a large nationally representative sample of households and asks their occupants to describe the personal crimes they have experienced.

The personal crimes described in the National Report include serious violent crime (i.e., rape, robbery, and aggravated assault) and simple assault.

With all its strengths, NCVS has limitations in describing the extent of juvenile victimizations. NCVS does not capture information from, or about, victims below age 12. Designers of the survey believe that younger respondents are not able to provide the information requested. Therefore, juvenile victimizations reported by NCVS cover only those that involve older juveniles. In addition, as with any self-report survey, NCVS has limited ability to address the sensitive issues of intrafamily violence and child abuse.

Some official data sources (such as law enforcement and child protective service agencies) can provide a partial picture of crime against juveniles, but such data from such agencies are limited to those incidents made known to them.
Violent victimizations were more likely among American Indian juveniles than other racial groups

More than one-third (38%) of rapes occurred between midnight and 6 a.m., a proportion higher than any other violent crime for that time period. As a result, the time patterns for serious violent victimizations overall differed slightly for males and females.

Time patterns for serious violent victimizations were similar for white juveniles and black juveniles, with half of all these victimizations occurring between noon and 6 p.m. In contrast, a greater proportion of simple assaults of black juveniles occurred during the evening hours.

Compared with cities and rural areas, suburban areas had the greatest proportion of violent juvenile victimizations occurring in the hours between noon and 6 p.m.

Note: Detail may not total 100% because of rounding.

In one-third of all sexual assaults reported to law enforcement, the victim was younger than age 12

Incident-based data provide information on crimes against persons under age 12

Because the National Crime Victimization Survey does not interview persons below the age of 12, little is known about crimes against these young juveniles. In recent years, however, a new information resource has developed that can shed light on this little-known portion of the crime problem. The FBI's National Incident-Based Reporting System (NIBRS) collects detailed data on crimes reported to law enforcement, including the demographic characteristics of victims and offenders, the relationships of victims to their offenders, and the location of the crimes. NIBRS data for 1991 through 1996 included data from 12 States: Alabama, Colorado, Idaho, Illinois, Iowa, Massachusetts, Michigan, North Dakota, South Carolina, Utah, Virginia, and Vermont. While relatively few law enforcement agencies report NIBRS data, the data reported for 1991 through 1996 contain information on more than 1.1 million incidents of violence.

1 in 18 victims of a violent crime known to police is under age 12

NIBRS data indicate that between 1991 and 1996, young juveniles (persons under the age of 12) were the victim in 5.5% of all violent crime incidents reported to a law enforcement agency. Young juvenile victims were more common in some types of crimes than others: kidnapping (21%), sexual assault (32%), robbery (2%), aggravated assault (4%), and simple assault (4%). More than one-third (37%) of these young victims were younger than age 7. About half (47%) of these young victims were female.

Age and relationship characteristics of sexual assault offenders vary with the age of the juvenile victim

- Older juvenile acquaintances and family members age 25 and older were the most common offenders in sexual assaults against very young children.
- About half of offenders who sexually assaulted juveniles ages 7–11 were older juvenile acquaintances and family members/acquaintances age 35 and older.
- Nearly half of all offenders who sexually assaulted juveniles ages 12–17 were acquaintances between ages 12 and 24.

Source: Authors' analyses of the FBI's National Incident-Based Reporting System master files for the years 1991–1996 [machine-readable data files].
1 in 3 victims of sexual assault is under age 12

The NIBRS data are an important source of information on the sexual assaults of young children, a crime that is hard to assess through victim surveys. These data point to large differences between the younger and older victims of sexual assault. For example, while just 4% of adult sexual assault victims were male, as were 8% of victims ages 12 to 17, 26% of sexual assault victims under age 12 were male. Younger sexual assault victims were also far more likely to have juvenile offenders.

Crime locations also differed by victim age. For adult victims, 57% of sexual assaults occurred in a residence or home, compared with 71% of the sexual assaults against older juveniles and 84% of the sexual assaults of children under age 12.

The relationship of victim to offender also differed by victim age. In sexual assaults of adults, the offender was a stranger in 25% of incidents, a family member in 12%, and an acquaintance in 63%. In contrast, for victims under age 12, the offender was a family member in 47% of incidents, an acquaintance in 49%, and a stranger in just 4%.

Sexual assaults of juveniles peak at 8 a.m., noon, and 3 p.m.; assaults of older juveniles also peak in the late evening hours.
The likelihood of victims reporting crime to police varies by victim age and the nature of the incident

**Juveniles are less likely to report violent crimes than adults are**

Finkelhor and Ormrod’s analysis of the National Crime Victimization Survey for 1995 and 1996 studied the variations in the proportion of crime victims reporting to police or other authorities (e.g., guards, school principals). The study revealed that adults were more likely than juveniles to report both completed and attempted violent crime to some authority regardless of the:

- Location of the incident.
- Presence of a weapon.
- Degree of injury.
- Age of the perpetrator.
- Relationship between the victim and perpetrator.

Their analysis also revealed that adults and juveniles generally report completed theft offenses to some authority in equal proportions. Juveniles, however, were more likely than adults to report thefts that took place in school and thefts of less valuable items (i.e., items worth less than $250).

**Juveniles are more likely to report some crimes than others**

Certain factors increase the likelihood that juveniles will report a crime to some official:

- Violent crimes were more likely to be reported when the incident took place at school rather than away from school (49% vs. 41%), resulted in injury rather than did not result in injury (57% vs. 40%), or involved an adult rather than a juvenile perpetrator (51% vs. 42%).

- The relationship between the victim and perpetrator or the presence of a weapon did not influence the probability of a violent incident being reported.

- Theft offenses were more likely to be reported by juveniles when the incident took place at school than away from school (51% vs. 22%) or involved a stranger rather than someone known to the victim (42% vs. 20%). In addition, thefts of items worth more than $250 were more likely to be reported than thefts of items worth less than $250 (49% vs. 38%).

- The proportion of theft offenses reported did not vary by the victim’s sex or by whether the perpetrator was an adult or juvenile.

The proportion of violent crimes reported by juveniles to the police increased with victim age

Overall, the proportion of violent crimes reported to any authority ranged between 42% and 48% for each age group between 12 and 17, but the authority to whom the incident was reported varied with the victim’s age.

The youngest victims of violence (youth ages 12 and 13) were more likely to report to authorities other than the police. By age 14, a greater proportion of violent crimes were reported to the police (26%) than to other officials (17%). The increasing use of police and the corresponding reduction in use of other authorities continued through age 17.

**Regardless of age, juveniles are more likely to report thefts to authorities other than police**

Reporting of theft offenses peaked at 44% for 14-year-old victims and declined to 31% for 17-year-old victims. While thefts are more likely to be reported to officials other than police, the proportion reported to the police increased with age, from 7% for 12-year-olds to 14% for youth age 17.

Who are runaways, and what happens when they are away?

In a 1988 national incidence study, parents or guardians of runaways who were gone overnight provided information about the runaways and their experiences while gone.

Most runaways were teenage girls (58%); most were 16 or 17 years old (68%). Most came from families that were or had been broken; only 28% lived with both (natural or adoptive) parents.

Most runaways initially stayed with someone they knew (66%) or did so at some time during the episode (94%). Some had spent time in unfamiliar or dangerous situations: 29% spent at least part of the episode without a familiar and secure place to stay, and 11% spent at least one night without a place to sleep. Many runaways returned home within a day or two, but about half (52%) were gone for 3 days or more, and 25% were gone for a week or more. For about half of the runaways, the caretaker knew the child’s whereabouts more than half of the time the child was away from home.

Many runaways had run away before, with 34% having run away at least once before in the past 12 months. Some traveled a long distance; approximately 16% went more than 50 miles from home during the episode, and about 10% went more than 100 miles.

Who are thrownaways, and what happens when they are away?

About half of thrownaway children were runaways whose parents or guardians made no effort to recover them, and about half were directly

Some categories of “missing” children are more numerous than others

The term “missing children” has been used for many years to describe children involved in very different kinds of events, making it difficult to estimate the magnitude of these phenomena or to formulate appropriate public responses. A 1988 national incidence study sought to measure the “missing child problem” by examining several distinct problems.

Broadly defined:

Source: Authors’ adaptation of Finkelhor, Hotaling, and Sedlack’s Missing, abducted, run-away, and thrownaway children in America. First report: Numbers and characteristics, national incidence studies.
forced to leave home. Parents of thrownaway children reported that most (84%) were 16 years old or older. The vast majority stayed with friends at least part of the time while they were away (88%), although 13% spent at least one night without a place to sleep. A majority (68%) returned home within 2 weeks. For about three-quarters of thrownaway children, the caretaker knew the child’s whereabouts more than half of the time the child was away from home.

Who are abducted children, and what happens when they are taken?

Parents of children abducted by a family member reported that most of these children were young: 33% were 2 to 5 years old, and 28% were 6 to 9 years old. Most were returned within a week: 62% were returned in 6 days or less, and 28% were returned in 24 hours or less. For just over half of children abducted by a family member, the caretaker knew the child’s whereabouts more than half of the time the child was away from home.

Many family abductions appeared to fall into the “serious” category, with the abducting parent:

- Preventing the child from contacting the caretaking parent (41%).
- Concealing the child (33%).
- Threatening or demanding something of the caretaking parent (17%).
- Taking the child out of State (9%).

Nonfamily abductions were studied in the records of a national sample of police departments. In these cases, three-quarters of the children were teenage girls, and half were 12 years old or older. Most of the victims were not missing for long: most were gone for less than 1 day; an estimated 12% to 21% were gone for less than 1 hour. Nearly all of the victims were forcibly moved during the episode: most were taken from the street; 85% of the cases involved force (75% with a weapon). Researchers estimated that, of the 200–300 nonfamily abductions that fell into the “serious” category (stereotypical kidnapings), about 100 resulted in homicides.

Who are other missing children, and what happens when they are missing?

Most lost or otherwise missing children tended to fall into one of two age groups: 4 years old or younger (47%) or 16 to 17 years old (34%). Of those incidences where the reason was known, most (57%) were missing for “benign” reasons (such as the child’s forgetting the time or misunderstandings between parents and children about when the latter would return or where they would be). The next largest group (28%) involved children who had been injured while they were away from home. Nearly all of these children had returned within 24 hours.
In 1993, nearly 3 million children were maltreated or endangered

The third National Incidence Study of Child Abuse and Neglect (NIS–3) reported information on children harmed or believed to be harmed by maltreatment in 1993. Child maltreatment includes physical, sexual, and emotional abuse, and physical, emotional, and educational neglect by a caretaker. Victims of maltreatment may die as the result of abuse or neglect or may experience serious or moderate harm. A child may also be in danger of harm as the result of maltreatment, or harm may be inferred when maltreatment is sufficiently severe.

NIS–3 included maltreatment reported to researchers not only by child protective service agencies, but by other investigatory agencies (e.g., police, courts, public health departments) and community institutions (e.g., hospitals, schools, daycare centers, and social service agencies). It did not include cases known only to family members or neighbors.

Most maltreated children were neglected in 1993

NIS–3 counts each incident of abuse or neglect that occurs. A single child may experience many types of abuse or neglect. In 1993, 70% of maltreated children were victims of neglect, and 43% were victims of abuse. More specifically:

- 47% were physically neglected.
- Almost equal proportions of maltreated children were physically abused (22%), emotionally neglected (21%), and emotionally abused (19%).
- 11% were sexually abused; 14% were educationally neglected.

More than half of all victims (55%) experienced serious or moderate harm as a result of maltreatment in 1993

Types of maltreatment were related to the characteristics of the child

The incidence of maltreatment varied by sex and age but not by race or ethnicity:

- The incidence of sexual abuse was almost three times greater among females than males in 1993. In contrast, emotional neglect was more common among males than females.
- The incidence of maltreatment increased more among males than among females between 1986 and 1993 (102% vs. 68%).
- Between 1986 and 1993, the incidence of maltreatment grew among all children except those ages 15–17.
- Moderate injuries were more frequent among older than younger children. Age differences were not found for other levels of injury.
- The incidence of endangerment was greater for younger children (ages 0–11) than older children (ages 15–17) in 1993.
- Children ages 0–2 and 15–17 had the lowest incidence of maltreatment in 1993.

There are several different types of child maltreatment

Child maltreatment occurs when a caretaker (a parent or parent substitute, such as a daycare provider) is responsible for, or permits, the abuse or neglect of a child. The maltreatment can result in actual physical or emotional harm, or it can place the child in danger of physical or emotional harm. The following types of maltreatment were included in NIS–3:

- **Physical abuse** includes physical acts that caused or could have caused physical injury to the child.
- **Sexual abuse** is involvement of the child in sexual activity to provide sexual gratification or financial benefit to the perpetrator, including contacts for sexual purposes, prostitution, pornography, or other sexually exploitative activities.
- **Emotional abuse** is defined as acts (including verbal or emotional assault) or omissions that caused or could have caused conduct, cognitive, affective, or other mental disorders.
- **Physical neglect** includes abandonment, expulsion from the home, failure to seek remedial health care or delay in seeking care, inadequate supervision, disregard for hazards in the home, or inadequate food, clothing, or shelter.
- **Emotional neglect** includes inadequate nurturance or affection, permitting maladaptive behavior, and other inattention to emotional/developmental needs.
- **Educational neglect** includes permitting chronic truancy or other inattention to educational needs.
More maltreatment was reported among lower-income families

Children from families with an annual income of less than $15,000 had substantially more maltreatment of all types in 1993 than children from families in other income groups. The abuse rate in these lowest-income families was two times the rate in other families, and the neglect rate was more than three times higher. Children in lowest-income families had higher injury rates in every injury category except fatalities.

Children of single parents were at higher risk of maltreatment

The overall risk of maltreatment in 1993 was twice as great for children living with single parents as for children living with both parents. Compared with children living with both parents, children living with single parents were twice as likely to be neglected and were marginally more likely to be abused. Children living with a single parent of either sex experienced a higher incidence of physical and educational neglect than those living with both parents and were marginally more likely to experience emotional neglect. Children from single-parent homes were at greater risk of injury and of being endangered by maltreatment than those living with both parents.

Maltreatment was related to family size

- Children living in larger families (with four or more children) were physically neglected almost three times more often than those living in one-child families and more than twice as often as those living in families with two or three children.
- Serious injuries were equally likely in families of all sizes.
- Moderate injury was more frequently experienced by maltreated children in larger families than those in families with either two or three children. Children in these largest families also experienced higher rates of endangerment.

The majority of maltreated children were victimized by their birth parents

Birth parents were responsible for the largest proportion of maltreatment victimizations in 1993 (78%), followed by other categories of parents (14%) and other perpetrators (9%). Children victimized by their birth parents were twice as likely to experience neglect as abuse. More specifically, among children victimized by their birth parents:

- The most common forms of maltreatment involved educational neglect (29%), physical neglect (27%), and physical abuse (23%).
- 16% were victims of emotional neglect, 14% were victims of emotional abuse, and 5% were victims of sexual abuse.

### Emotional abuse and neglect increased more than other forms of maltreatment between 1986 and 1993

*Indicates that increase did not reach statistical significance.

Note: Victims were counted more than once when more than one type of abuse or neglect had occurred.

Source: Authors’ adaptation of the National Center on Child Abuse and Neglect’s The third National Incidence Study of Child Abuse and Neglect (NIS–3).
In contrast to children victimized by their birth parents, those maltreated by other categories of parents were almost twice as likely to be abused as to be neglected. For example:

- Physical abuse was the most common form of maltreatment (37%).
- One-quarter of these children were victims of sexual abuse.
- One-fifth were victims of educational neglect.
- The least common forms of maltreatment involved physical neglect (9%) and emotional abuse (13%).

**Fatal or serious injury was more likely for children maltreated by birth parents than by others**

**Most maltreatment cases were identified by schools**

Because of the large volume of children attending schools, more maltreated children were identified by schools in 1993 than by all other community agencies and institutions combined:

- Schools 54%
- Police/sheriff 10
- Hospitals 6
- Social services 6
- Daycare centers 5
- Mental health 3
- Juvenile probation 2
- Public health 2
- All others 12

**1 in 3 alleged maltreatment cases was investigated by child protective service agencies**

Child protective service agencies investigated 33% of the cases known to community agencies and institutions in 1993. The remaining cases either were not reported to child protective service agencies or were reported but not investigated. The highest investigation rates occurred among cases identified by police and sheriff departments (52%), hospitals (46%), and mental health agencies (42%). In contrast, the lowest investigation rates occurred among cases identified by daycare centers (3%) and public health agencies (4%).

**Investigations were more likely in cases involving abuse than neglect**

Cases in which children were alleged to be physically or sexually abused were investigated by child protective services more frequently than other maltreated children.
Most abuse and neglect cases enter the child welfare system through child protective service agencies

What are child protective services?

The term “child protective services” generally refers to services provided by an agency authorized to act on behalf of a child when parents are unable or unwilling to do so. In all States, these agencies are mandated by law to conduct assessments or investigations of reports of child abuse and neglect and to offer rehabilitative services to families where maltreatment has occurred or is likely to occur.

While the primary responsibility for responding to reports of child maltreatment rests with State and local child protective service agencies, prevention and treatment of abuse and neglect can involve professionals from many disciplines and organizations. Although variations exist among jurisdictions, community response to child maltreatment typically includes the following sequence of events:

Identification. Individuals likely to identify abuse are often those in a position to observe families and children on an ongoing basis. This may include educators, law enforcement personnel, social service personnel, medical professionals, probation officers, daycare workers, mental health professionals, and the clergy, in addition to family members, friends, and neighbors.

Reporting. Some individuals, such as medical and mental health professionals, educators, childcare providers, social service providers, law enforcement personnel, and clergy, are often required by law to report suspicions of abuse and neglect. Some States require reporting by any person having knowledge of abuse or neglect.

Child protective service or law enforcement agencies usually receive the initial report of alleged abuse or neglect, which may include the identity of the child, information about the nature and extent of maltreatment, and information about the parent or other person responsible for the child (caretaker). The initial report may also contain information identifying the individual causing the alleged maltreatment (perpetrator), the setting in which maltreatment occurred, and the person making the report.

Intake and investigation. Protective service staff are responsible for determining whether the report constitutes an allegation of abuse or neglect and how urgently a response is needed. The initial investigation involves gathering and analyzing information from and about the child and family. Protective service agencies may work with law enforcement and other agencies during this period. Caseworkers generally respond to reports of abuse and neglect within 2 to 3 days. A more immediate response may be required if it is determined that a child is at imminent risk of injury or impairment.

If the intake worker determines that the referral does not constitute an allegation of abuse or neglect, the case may be closed. If there is substantial risk of serious physical or emotional harm, severe neglect, or lack of supervision, a child may be removed from the home under provisions of State law. Most States require that a court hearing be held shortly after the removal to approve temporary custody by the child protective service agency. In some States, removal from the home requires a court order.

Following the initial investigation, the protective service agency generally concludes one of the following: (1) sufficient evidence exists to support or substantiate the allegation of maltreatment or risk of maltreatment; (2) sufficient evidence does not exist to support maltreatment; or (3) maltreatment or the risk of maltreatment is indicated, although sufficient evidence to conclude or substantiate the allegation does not exist. Should sufficient evidence not exist to support an allegation of maltreatment, additional services may still be provided if it is believed there is risk of abuse or neglect in the future.

Assessment. Protective service staff attempt to identify the factors that contributed to the maltreatment and to address the most critical treatment needs.

Case planning. Case plans are developed by protective services, other treatment providers, and the family in an attempt to alter the conditions and/or behaviors resulting in child abuse or neglect.

Treatment. Protective service and other treatment providers implement a treatment plan for the family.

Evaluation of family progress. After the treatment plan has been implemented, protective services and other treatment providers evaluate and measure changes in family behavior and the conditions that led to child abuse or neglect, assess changes in the risk of maltreatment, and determine when services are no longer necessary. Case managers often coordinate the information from several service providers when assessing the case’s progress.
Case closure. While some cases are closed because the family resists intervention efforts and the child is considered to be at low risk of harm, others are closed when it has been determined that the risk of abuse or neglect has been eliminated or sufficiently reduced to a point where the family can protect the child from maltreatment without further intervention.

If it is determined that the family will not be able to protect the child, the child may be removed from the home and placed in foster care. If the child cannot be returned home to a protective environment within a reasonable timeframe, parental rights may be terminated so that permanent alternatives for the child can be found.

One option available to child protective services is referral to juvenile court

Substantiated reports of abuse and neglect do not necessarily lead to court involvement if the family is willing to participate in the child protective agency’s treatment plan. The agency may, however, file a complaint in juvenile court if the child is to be removed from the home without parental consent or if the parents are otherwise uncooperative.

Adjudicatory hearings primarily focus on the validity of the allegations, while dispositional hearings address the case plan (e.g., placement, supervision, and services to be delivered). Typical dispositional options include treatment and services provided by protective service agencies, temporary custody granted to the State child protective agency, foster care, termination of parental rights, permanent custody granted to the State child protective agency, and legal custody given to a relative or other person. Both adjudicatory and dispositional hearings are held within a timeframe specified by State statute.

Although not all abuse and neglect cases become involved with the court, the juvenile court is playing an increasingly significant role in determining case outcomes. The Federal Adoption Assistance and Child Welfare Act of 1980 (Public Law 96–272) required greater judicial oversight of the child protective service agency’s performance. This legislation was passed in an attempt to keep children from being needlessly placed in foster care or left in foster care indefinitely. The goal of this legislation was to enable the child to have a permanent living arrangement (e.g., return to family, adoption, or placement with other relatives) as soon as possible.

Courts often review decisions to remove children from home during emergencies, oversee agency efforts to prevent placements and reunite families, approve agency case plans designed to rehabilitate families, periodically review cases, and decide whether to terminate parental rights in cases involving children unable to return home. Courts review case plans of all court-involved cases prior to implementation and maintain ongoing involvement until the child is either returned home or placed in a permanent, adoptive home.
A national data system monitors the caseloads of child protective services

The National Center on Child Abuse and Neglect (NCCAN) annually collects child maltreatment data from child protective service agencies. The National Child Abuse and Neglect Data System (NCANDS) employs both a summary and a case-level approach to data collection. Summary data provide national information on a number of key indicators of child abuse and neglect cases in 1996. Case-level data provide descriptive information on cases referred to child protective service agencies during the same year.

About 1.6 million child abuse and neglect investigations were conducted in 1996

Child protective service agencies conducted investigations on 80% of the estimated 2 million reports of child abuse and neglect in 1996. In 35% of these investigations, the allegation was either substantiated (i.e., the allegation of maltreatment or risk of maltreatment was supported or founded) or indicated (i.e., the allegation could not be substantiated, but there was reason to suspect the child was maltreated or was at risk of maltreatment). More than half (58%) of all investigations were not substantiated or indicated. The remaining 7% were closed without a finding or resulted in another disposition. Detailed data from 11 States indicated that reports from professionals were more likely than those from nonprofessionals to be substantiated or indicated (31% vs. 33%).

Most perpetrators were related to the victim

The 1996 national summary data on substantiated or indicated maltreatment found the following:

- 52% of victims were female.
- 55% of victims were white, 28% were black, 12% were Hispanic, and 5% were other races.
- 19% of victims were age 2 or younger, 52% were age 7 or younger, and 7% were age 16 or older.
- 80% of perpetrators were parents of the victim.
- An estimated 1,077 children died as the result of maltreatment in 1996.
- About 16% of victims in substantiated or indicated cases were removed from their homes.

Maltreatment reports may involve more than one child—in 1996 over 3 million children were the subjects in 2 million reports

Reports of alleged maltreatment increased 161% between 1980 and 1996. The increasing trend in child maltreatment reports is believed to be the result, at least in part, of a greater willingness to report suspected incidents. Greater public awareness both of child maltreatment as a social problem and of the resources available to respond to it are factors that contribute to increased reporting.

Note: Child reports are counts of children who are the subject of reports. Counts are duplicated when an individual child is the subject of more than one report during a year.

Case-level data from States provide a profile of victims

Detailed information from States reporting case-level data on victims of substantiated or indicated maltreatment in 1996 found the following:

- Neglect was the most common form of maltreatment found among all age groups (58%).
- Younger children (under age 8) were more likely than older children (age 8 and older) to have been neglected (65% vs. 49%).
- Older victims were more likely than younger victims to have been physically abused (29% vs. 19%) or sexually abused (15% vs. 7%).

As the primary provider of childcare, females were the perpetrators in most maltreatment

<table>
<thead>
<tr>
<th>Percent of perpetrators</th>
</tr>
</thead>
<tbody>
<tr>
<td>Male only</td>
</tr>
<tr>
<td>Victim age</td>
</tr>
</tbody>
</table>

| 0–17 | 22% | 54% | 24% | 100% |
| Younger than 1 | 5 | 70 | 25 | 100 |
| 1–5 | 16 | 58 | 25 | 100 |
| 6–11 | 25 | 52 | 24 | 100 |
| 12–17 | 35 | 42 | 23 | 100 |

| Maltreatment type |

| All | 22% | 54% | 24% | 100% |
| Physical abuse | 33 | 41 | 26 | 100 |
| Neglect | 10 | 64 | 25 | 100 |
| Medical neglect | 5 | 70 | 25 | 100 |
| Sexual abuse | 62 | 9 | 29 | 100 |
| Psychological abuse | 26 | 37 | 37 | 100 |

In 1996, over one-half (54%) of maltreatment cases involved only female perpetrators, and about one-quarter (24%) involved both male and female perpetrators. As a result, at least one female was identified as a perpetrator in more than 3 in 4 maltreatment cases (78%). In contrast, at least one male was identified as a perpetrator in about 1 in 2 cases (46%).

Male perpetrators were more common in maltreatment cases involving older victims. For example, at least one male was identified as the perpetrator in 30% of cases involving victims under the age of 1, compared to 58% of cases involving victims ages 12–17.

For most maltreatment types, females were more likely than males to be identified as a perpetrator. The one exception is sexual abuse. At least one male was identified in 91% of these reports. In contrast, at least one female was identified in 38% of cases involving sexual abuse.

Female victims were three times more likely than males to have experienced sexual abuse (16% vs. 5%) and less likely to be victims of some form of neglect (58% vs. 70%).

Death due to child abuse and neglect was found mostly among very young children. Three in four deaths (76%) involved children under age 4.
Overall, the proportion of maltreatment involving a female perpetrator generally declined with victim age

Females were reported as the perpetrator of physical abuse against younger victims more often than males—this pattern reverses in cases of older victims

Male-only perpetrators were over three times more common than female-only for cases involving 17-year-old male victims of physical abuse. In contrast, male-only perpetrators were only slightly more common than female-only perpetrators for 17-year-old female victims. The proportion of cases involving both male and female perpetrators was similar among male and female victims.

The difference in the number of sexual abuse cases involving male perpetrators and the number involving female perpetrators grew with victim age

In cases of sexual abuse, male-only perpetrators were more common than female-only perpetrators. The majority of sexual abuse cases involving female perpetrators also involved male perpetrators.

Note: Data are for 1996. The male proportion includes cases with at least one male perpetrator and no females. The female proportion includes cases with at least one female perpetrator and no males. The male and female perpetrators proportion includes cases with at least one male and one female perpetrator. It should be noted that cases identifying multiple perpetrators do not imply equal involvement of each perpetrator.

Between 1992 and 1995, growth in reported incidents of abuse and neglect was three times greater for American Indian children under age 15 than for Asian children in that age group.

In 1995, child victimization rates for American Indian children and black children were at least twice as high as rates for other racial and ethnic groups.

Note: Rates were calculated on the number of children age 14 or younger because this group accounts for at least 80% of the victims of child abuse and neglect.
