**Final Report
1/15/14**

This project was supported by Grant No. 2011-JU-FX-0018 awarded by the Office of Juvenile Justice and Delinquency Prevention, Office of Justice Programs, U.S. Department of Justice. Points of view or opinions in this document are those of the author and do not necessarily represent the official position or policies of the U.S. Department of Justice.

Abstract

The overall goal of this project was to evaluate whether cross-age mentoring is an effective model for use with middle school children at varying degrees of risk for juvenile delinquency. Middle school youth (6th graders) with at least one other risk factor for juvenile delinquency were recruited to receive mentoring from high school juniors and seniors trained as mentors. Mentees received one of three conditions: relational, instrumental or risk reduction. A quasi-experimental research design with data collection at baseline, program completion, and at 3 months post program completion was implemented. Data was collected on a set of indicators prior to program start-up, program completion, and three-months post program completion.

Introduction

Juvenile delinquency is a major social problem facing the field of human services. Mentoring has great potential for prevention of juvenile delinquency (e.g., Elliot, 1994; Keating, Tomishima, Foster, & Alessandri, 2002; King, Vidourcek, Davis, & McClellan, 2002; McGill, Mihalic, & Grotper, 1997). DuBois, Holloway, Valentine, and Cooper's (2002) meta-analysis of 59 mentoring studies found mean effect sizes of .14 (fixed effects) and .18 (random effects). However, effect sizes were significantly larger ($d_s = .24, .25$) for mentoring programs that implemented best practices, i.e., monitoring program implementation, ongoing training and supervision for mentors, clear expectations for contact frequency and length, and involving parents. Programs that included youth based on environmental risk factors (e.g., socioeconomic disadvantage) had larger effects (DuBois, Holloway, Valentine, and Cooper, 2002).

One such comprehensive mentoring approach is *cross age developmental mentoring*. Developmental mentoring is a structured, cross-age (high school students mentor younger students), school-based approach that aims to promote children's development by increasing connectedness to self, others, and society (Karcher, 2005). The mentoring relationship is seen as the primary way in which mentees develop in the areas of self-esteem, connectedness, identity, and academic attitudes. In a randomized study, Karcher (2005) found connectedness to school and parents were greater for mentees participating in a developmental mentoring program than for the comparison group. Results suggest that the experience with the mentor best explained changes in mentees' self-management, self-esteem, and social skills; not solely exposure to mentoring curricula. Studies of cross-age mentoring programs have consistently reported positive impact on mentees, including: improvements in mentees' attitudes toward and connectedness to school and peers (Bowman & Myrick, 1987; Karcher, 2005), academic achievement (Karcher, Davis, & Powell, 2002), behavior problems (Bowman & Myrick, 1987), social skills (Karcher, 2005; Noll, 1997).

The research reported here investigated the impact of cross-age developmental mentoring on youth at risk for juvenile delinquency. In particular, youth who are truant, are poor achievers in school, lack positive peer relationships, and/or at risk or have been victimized through abuse and neglect. These factors were selected because of the established link between juvenile delinquency and truancy (e.g., Brier, 1995; Elliott, Huizinga, & Menard, 1989; Elliott & Voss, 1974; Fagan & Pabon, 1990; Herrenkohl et al., 2001; Maguin & Loeber, 1996; Thornberry, Moore, & Christenson, 1985), poor academic achievement (e.g., Farrington & Loeber, 1999; Herrenkohl et al., 2000), lack of positive peer relationships (e.g., Elliott & Menard, 1996; Elliott, 1994; Patterson & Bank, 1989; Patterson, Capaldi, & Bank, 1991; Higgins & Piquer, 2010), and victimization through abuse and neglect (English, Widom, & Brandford, 2002; Stewart, Dennison, & Waterson, 2002)

Methodology

Design. A longitudinal, quasi-experimental design was used to test the value of cross-age developmental mentoring. Mentors (high school seniors and juniors) were recruited from a high school and trained in and delivered in one of the following configurations of mentoring: 1) *relational approach* (starting with mentoring that focus on Self, Friends, Reading, Peers, Teacher, and then culture); 2) *Instrumental approach* (starts with mentoring that focuses on goal-directed, future oriented, adult/conventional people, and then moves toward more relational culture, teachers, reading, peers, friends, and self); 3) *risk reduction approach* (a specific educational program designed to address risk factors for juvenile delinquency: truancy, poor academic achievement, poor peer relationships, and victimization through maltreatment). The

first two approaches are from the curriculum developed by Karcher (2005) and the latter was developed by the authors based on the format used by Karcher in his curriculum but with content specific to addressing risk factors as listed above. Mentors were matched (seniors, juniors) with sixth grade students as suggested by Karcher (2008). In order to better control for confounding variables that may be school specific, schools were randomly assigned to a condition as described above. All mentees at a particular school received one of the conditions above. All the programs were implemented as a 4 month (one semester) approach in year 1 at all schools and as an 8 month (full school year) program in all schools in year 2.

Sample. School personnel (i.e. teachers, counselors, youth services coordinators, administrators) were provided flyers with information on the research study. School personnel shared this information with families. Families who were interested in participating shared their contact information with the school and agreed to be contacted or contacted the researchers directly to learn more about the research. A member of the research team made contact with the family and reviewed the research and discussed consent procedures, and enrollment into the study. **Mentees' selection.** Middle school youth (6th graders) with at least one risk factor identified by school personnel (poor academic performance-below average or failing in core subjects, poor peer relationships as identified by school personnel, at risk for or history of victimization, and school absences-meeting the number of absences criteria for being identified at risk for or actually being truant) for juvenile delinquency were recruited to participate in the study. **Mentors' selection.** Flyers were distributed to students by school personnel. Criteria for selection included good academic standing (B or better average), identified/ recommended/ screened by school personnel (i.e. teacher, counselor, principal, youth services coordinator, CO-OP teacher) as having potential for leadership and mentoring potential. Interested students and their families were provided with information about the research. A member of the research team made contact and reviewed the research and discussed consent procedures, and enrollment into study. **Parents** of selected mentees were asked to participate in the research by completing set of surveys prior to after the mentoring program ended. **Teachers.** The 6th grade teachers identified as having the best knowledge of those 6th graders participating in mentoring were contacted to complete surveys. Teachers were identified once students participating in the study had been identified.

Measures- Mentee. A set of measures were proposed. These include **Mentee Demographics:** These are gender, race/ethnicity, current grade, grades, level of academic performance as well as school history including attitudes about school. **School performance** was assessed by looking at course grades as reported by students. **Behavior problems** was measured by the Behavior Rating Index for Children (BRIC) (Stiffman, Orme, Evans, Feldman, Keeney, 1984), a 13 item, Likert scale that measures the degree of children's behavior problems. It has good internal consistency (.80 to .86), and can be used by children to self-assess their behavior. **Family Functioning** was measured pre- and post-program completion and will be operationalized by the 5-item Family APGAR Questionnaire designed to measure the extent of family relationship problems from the perspective of family members. **Connectedness** was measured using the Hemingway Measure of Preadolescent Connectedness (Version 3, Karcher, 2001). The *Hemingway* includes 78 statements about preadolescents' degree of involvement/activity, attitude/affection for their parents, friends, school, and reading. A sample item for activity/involvement is "I work hard at school." A sample item for attitude/affection is "I enjoy spending time with my friends." The measure uses an interval scale from 1 (*not true*) to 4 (*very true*). The inter-item reliability for the subscales ranged from .73 for Friends to .89 for Reading.

Total Connectedness reflected the average of all three subscales. (Karcher, 2001; Karcher & Lee, 2002). *Self-esteem* was measured by The Rosenberg Self-Esteem Scale. This is a 10-item Likert scale with items answered on a four point scale - from strongly agree to strongly disagree regarding positive and negative views of self. *Engagement in delinquency behaviors* was measured by 11 items specifically asking about behaviors indicative of delinquency that were used in the Pittsburgh Youth Study. Respondents are also asked if they have ever engaged in these behaviors to assess their actual engagement in these behaviors. *Relationship satisfaction* was measured by 8 items (extremely dissatisfied=1 to extremely satisfied=7) developed for this study that ask about life and relationship with family, parents, friends, siblings, teacher and school. Mentor demographics. *Satisfaction with mentoring and with mentoring program* was measured by 4 items (on a 1=not satisfied to 5=very satisfied) focusing on mentoring received, mentoring relationship, mentoring activities, and overall satisfaction. ***Measures- Family. Satisfaction with mentoring and with mentoring program*** is measured by 4 items (on a 1=not satisfied to 5=very satisfied) focusing on mentoring received, mentoring relationship, mentoring activities, and overall satisfaction. ***Measures-Mentors: Satisfaction with training*** will be measured at post-training using the modified version of the 12-item Level One Training Evaluation Scale (Barbee & Barber, 1995), which includes measures of utility and affective reactions. *Satisfaction with mentoring and with mentoring program* is measured by 4 items (on a 1=not satisfied to 5=very satisfied) focusing on mentoring received, mentoring relationship, mentoring activities, and overall satisfaction. ***Teacher measures. Teacher Demographics:*** These include gender, race & ethnicity, years teaching. ***Assessment of Child's Behavior:*** This will be measured by the teacher's version of Behavior Rating Index for Children (BRIC) (Stiffman, Orme, Evans, Feldman, Keeney, 1984), a 13 item, Likert scale that measures the degree of children's behavior problems. It has good internal consistency (.80 to .86), and can be used teachers to assess their student's behavior. ***Child's Connectedness*** will be measured using the Teacher's version of Hemingway Measure of Preadolescent Connectedness (Karcher, 2001; Karcher & Lee, 2002). A number of other measures were initially proposed in addition to those described above. However because of low response rate or incompleteness of the survey items, those measures were not analyzed and thus not included in this narrative.

Data Collection. Data was collected from: mentee, family, mentor, and teacher. Data collection was attempted at 3 times: baseline (after recruitment to mentoring and prior to receiving any mentoring), at the end of the mentoring, and at 3-months post-mentoring (only from mentees and their families). All measures were paper and pencil and were administered at school sites for mentors, mentees, and teachers. Families completed measures at scheduled meetings or received measures via mailings.

Consent Procedures . Prior to the collection of data, the research proposal was submitted to the University of Louisville IRB as well as the local school system's IRB for review and approval. Once IRB approval was granted by both institutions, data collection took place.

RESULTS

Year 1

The mentoring programs (relational, instrumental, risk reduction) were implemented over a 4 month (one semester) period in Year 1. A description of the curriculums used is provided at the end of this document.

Mentees

What is the profile of mentees that participated in mentoring during the 1st year of the program? The table below lists the characteristics of 1st year mentees across the three schools. On the whole, they were majority male, African American, tended to be the middle child, and between the ages of 11 and 13. Most of the mentees reported as being good to fair students with “B” grades. Few of them liked coming to school “a lot”, participated in three or more school activities, or reported skipped school. However, between 36% to 50% reported they had been suspended from school.

Year 1 Mentee Sample Demographics

Characteristics		School 1 (Relational) (n=22)		School 2 (Instrumental) (n=22)		School 3 (Risk Reduction) (n=22)

Were mentees satisfied with the mentoring they received? Overall, mentees participating in the three types of mentoring rated the mentoring received fairly high (above a 3.5 on a scale of 1-5 with 5 being higher level of satisfaction) across the various aspect of satisfaction. On the various aspects of mentoring satisfaction, mentees receiving risk reduction mentoring had the highest average satisfaction ratings, mentees receiving instrumental mentoring had the lowest average satisfaction ratings, and mentees receiving relational mentoring were in the middle of these two in regards to their average satisfaction ratings. When compared to each other, mentees across the three types of mentoring only significantly differed on one aspect of mentoring, their overall satisfaction with the mentoring program. Mentees participating in risk reduction reported significantly higher overall satisfaction with mentoring than mentees participating in instrumental mentoring. No such significant difference was found between any other groups.

Satisfaction with Mentoring (Year 1)

Aspect of Mentoring	Type of Mentoring	N	Mean	SD	F	Sig.
How satisfied are you with the mentoring you received?	Relational	16	4.56	.89	1.344	.270
	Instrumental	18	4.22	1.26		
	Risk Reduction	18	4.72	.46		
	Total	52	4.50	.93		
How satisfied are you with the mentoring relationship you have with your mentor?	Relational	16	4.62	.71	1.168	.319
	Instrumental	18	4.22	1.21		
	Risk Reduction	18	4.66	.84		
	Total	52	4.50	.96		
How satisfied are you with the mentoring activities you participated in?	Relational	16	4.12	1.14	.824	.444
	Instrumental	18	3.77	1.26		
	Risk Reduction	18	4.22	.80		
	Total	52	4.03	1.08		
Overall, how satisfied are you with the mentoring program?	Relational	16	4.62	.71	3.990	.025*
	Instrumental*	18	3.83	1.42		
	Risk Reduction*	18	4.72	.75		
	Total	52	4.38	1.08		

Was there any significant change in outcomes (academic rating, satisfaction, connectedness) reported by mentees from beginning (at pretest) to end of the program (posttest) as a result of participating in mentoring? Paired t-tests conducted (see table below) revealed that mentees participating in mentoring with a relational approach had the most number of outcomes with significant change from pretest to posttest in comparison to mentees receiving instrumental or risk reduction mentoring. However, the significant change observed was in the expected direction (higher scores at posttest) in only in one aspect, satisfaction with family life (relational approach) and satisfaction with sibling relationships (risk reduction). These results should be interpreted cautiously given the small sample available for analysis.

Outcomes by Intervention from Pretest to Posttest (Year 1)
[Only those measures with significant findings are reported]

Mentoring Intervention	Measure	N	Pre-test		Post-test		<i>t</i>	<i>df</i>	<i>p</i>
			mean	SD	mean	SD			
Relational	Excellent, good, fair, or poor student	14	2.29	.726	1.78	.801	-2.463	13	.029
	Satisfaction with family life	13	5.84	1.21	6.46	.518	2.309	12	.040
	Connectedness to kids from other cultures	13	13.61	1.85	11.84	3.36	-2.530	12	.026
	Connectedness to Father	10	17.90	1.44	16.30	2.00	-2.667	9	.026
	Teacher's perception of mentee's connectedness to peers	9	21.55	2.74	19.11	2.71	-3.119	8	.014
Instrumental	Teacher's perception of mentee's connectedness to peers	10	20.80	3.15	19.00	3.05	-3.139	9	.012
Risk Reduction	Satisfaction with sibling relationships	16	5.62	1.14	6.25	.683	2.179	15	.046

Was there any significant change in wellbeing (reported behavioral problems, self-esteem, family functioning, or number of delinquency type of behaviors engaged in) reported by mentees from beginning (at pretest) to end of the program (posttest) as a result of participating in mentoring? The table below reports the results of paired t-tests conducted on completed responses from mentees across the three types of mentoring implemented in year 1. The results indicate that only family wellbeing/functioning as measured by the Family APGAR was found to be reported to be higher at the end of the program participation for mentees participating in relational mentoring. This higher score was statistically significant. These

results should be interpreted cautiously given the small sample with complete data available for analysis.

Wellbeing Outcomes by Intervention from Pretest to Posttest (Year 1)

Intervention	Measure	N	Pre-test		Post-test		t	df	p
			mean	SD	mean	SD			
Relational	Child Behavior Rating Index (BRIC)	10	28.00	21.88	30.25	22.95	.247	9	.810
	Self-Esteem (Rosenberg self-esteem scale)	7	30.28	5.43	29.85	4.33	-.359	6	.732
	Family Functioning (Family APGAR)	12	12.91	1.78	14.33	1.43	2.237	11	.047*
	#of delinquency type of behaviors engaged in	12	2.00	3.13	1.25	1.28	-1.192	11	.258
Instrumental	Child Behavior Rating Index (BRIC)	11	30.68	26.12	35.00	18.77	.934	10	.372
	Self-Esteem (Rosenberg self-esteem scale)	14	30.21	3.98	31.42	6.32	.729	13	.479
	Family Functioning (Family APGAR)	11	12.27	2.32	12.72	2.32	.809	10	.437

Risk Reduction	Child Behavior Rating Index (BRIC)	14	38.21	14.15	37.5	23.5	-.120	13	.906
	Self-Esteem (Rosenberg self-esteem scale)	13	33.07	3.45	33.00	5.21	-.098	12	.924
	Family Functioning (Family APGAR)	14	12.57	2.10	13.00	1.79	.611	13	.551
	#of delinquency type of behaviors engaged in	16	1.06	.928	1.75	2.04	1.546	15	.143

Were there any significant differences between types of mentoring received and pre-post change in relationship satisfaction? Types of mentoring were compared on change scores for various domains of satisfaction. Change scores were computed (by subtracting pretest scores from post scores). ANOVAs were performed to analyze differences in change scores across the three mentoring types. The results did not indicate any statistically significant difference in relationship satisfaction change scores. In other words, there was no statistically significant difference between types of mentoring received and change in satisfaction domains (see table below).

Relationship Satisfaction by Type of Mentoring

Change in	Type of Mentoring	N	Mean	SD	F	Sig.
life satisfaction	Relational	13	.076	.493	.963	.390
	Instrumental	17	.764	1.82		
	Risk reduction	16	.375	1.25		
	Total	46	.434	1.36		
family life satisfaction	Relational	13	.615	.960	.464	.632

	Total	45	.244	1.86		
Satisfaction with relationship with father	Relational	12	-.083	.996	1.056	.358
	Instrumental	15	.533	2.23		
	Risk reduction	15	-.400	1.76		
	Total	42	.023	1.78		

Were there any significant differences between types of mentoring received and satisfaction with various aspects of school? Types of mentoring were compared on change scores for satisfaction related to various aspects of school. Change scores were computed (by subtracting pretest scores from post scores) and ANOVAs were performed. The results did not indicate any statistically significant difference in school related satisfaction change scores. In other words, there was no statistically significant difference in change scores between types of mentoring received and satisfaction with various aspects of school.

Satisfaction change related to various aspects of school -Year 1

Change in	Type of Mentoring	N	Mean	SD	F	Sig.
Satisfaction with relationship with teachers	Relational	13	.307	1.60	.345	.710
	Instrumental	16	.062	1.69		
	Risk reduction	16	.562	1.78		
	Total	45	.311	1.67		
Satisfaction with school	Relational	13	.769	1.83	1.755	.185

	Total	46	-.326	2.18		

Were there any significant differences between types of mentoring received and pre-post change in connectedness? Types of mentoring were compared on change scores for various domains of connectedness as measured by the Hemingway Measure of Preadolescent Connectedness (Karcher, 2001; Karcher & Lee, 2002). Change scores were computed (by subtracting pretest scores from post scores) and ANOVAs were performed. Connectedness to mother (change scores) among mentees in the relational mentoring was statistically different (decrease) than change in connectedness to mother (change scores --increase) for mentees in risk reduction mentoring. In addition, mentees in instrumental mentoring did not statistically differ from relational and risk reduction mentoring participants in regards to change in connectedness to mother, although both instrumental and risk reduction had increased (change scores) connectedness to mother (see table below).

Change in Connectedness (Hemmingway) (Year 1)

Connectedness to (subscale):	Type of Mentoring	N	Mean	SD	F	Sig.

For youth who had participated in the three types of mentoring program, is there any difference in their reported wellbeing at 6 month follow-up? Relational mentoring participants had statistically significant higher family APGAR (wellbeing/functioning) scores than participants in risk reduction mentoring but not those in instrumental mentoring. There was no statistically significant difference in family APGAR (wellbeing/functioning) scores between the risk reduction and instrumental mentoring groups. No group differences were found in other domains of wellbeing that were examined (see table below).

Wellbeing 6-month Follow-Up (Year 1)

Measure	Type of Mentoring	N	Mean	SD	F	Sig.
Behavior Rating Index for Children(BRIC)	Relational	12	26.25	15.68	.750	.479

Mentors

What is the profile of mentors that participated in mentoring during the 1st year of the program? The table below lists the characteristics of 1st year mentors across the three schools. On the whole, they were majority female, African American or other, tended to be the Oldest child in their family, and between the ages of 16 and 18. Most of them reported being good students with average GPA above 3.0. Few of them liked coming to school “a lot”. Majority participated in one or more school activities. Between 9 to 13.6% or reported skipped school. However, between 9% to 27% reported they had been suspended from school.

Overall, how did mentors evaluate the training they received to become a mentor and the mentoring they provided?(Year 1). Ratings ranged from 3.2 to 5 (range 1 to 5 with 5 being the highest rating) Overall, results indicate that mentors assigned to instrumental mentoring found the mentor training less practical, less important, felt they knew less about what to do as a mentor after the training, less comfortable doing mentoring activities, than mentors assigned to either relational or risk reduction mentoring. Thus, they reported being less prepared to provide mentoring.

After completing the mentoring program, mentors assigned to instrumental mentoring were less likely to be satisfied with the mentoring they provided, the mentoring activities they participated in, and their overall satisfaction with the mentoring program (see table below).

Aspect of training and mentoring		N	Mean	Std. Deviation	F	Sig.

Parents**Parents' Satisfaction with Mentoring**

In year 1, how satisfied were parents with mentoring received by their child? Very few responses were received from parents of mentees after completion of the mentoring program by their child. And, unfortunately, no responses were received from parents of mentees participating in risk reduction mentoring. The table below indicates that mean satisfaction rating ranged from 3.60 to 5.00 (possible range 1-5, with 5 indicating highest level of satisfaction). Unfortunately, no responses were received from parents of mentees participating in risk reduction mentoring.

Parental Satisfaction with Mentoring (Year 1)

Aspects of mentoring	Type of mentoring	n	mean	Standard deviation
How satisfied are you with the mentoring your child has received?	Relational	2	5.00	.000
	Instrumental	5	3.60	1.949
	Risk reduction	0	.	.
	Total	7	4.00	1.732
How satisfied are you with your child's relationship with his or her mentor?	Relational	2	5.00	.0000
	Instrumental	5	3.80	1.788
	Risk reduction	0	.	.
	Total	7	4.14	1.573
How satisfied are you with the mentoring activities your child participated in?	Relational	2	5.00	.0000

Year 2

Mentees

What is the profile of mentees that participated in mentoring during the 2nd year of the program? The table below lists the characteristics of 2nd year mentees across the three schools. On the whole, they were majority male, African American, tended to be the middle child, and between the ages of 11 and 13. Most of the mentees reported as being good students with “A” grades. Few of them liked coming to school “a lot”, participated in two or more school activities, or reported skipped school. Only between 4% to 36% reported they had been suspended from school.

Year 2 Mentee Sample Demographics

Were mentees satisfied with the mentoring they received? Overall, mentees participating in the three types of mentoring rated the mentoring received fairly high (above a 3.3 on a scale of 1-5 with 5 being higher level of satisfaction) across the various aspect of satisfaction. On three out of four aspects of mentoring satisfaction, mentees receiving risk reduction mentoring had the lowest average satisfaction ratings, compared to other mentoring types. When compared to each other, mentees across the three types of mentoring did not significantly differ on any aspect of mentoring satisfaction.

Satisfaction with Mentoring (Year 2)

Aspect of Mentoring	Type of Mentoring	N	Mean	SD	F	Sig.
How satisfied are you with the mentoring you received?	Relational	16	4.43	.629	.562	.574
	Instrumental	18	4.22	1.06		
	Risk Reduction	17	4.52	.874		
	Total	51	4.39	.873		
How satisfied are you with the mentoring relationship you have with your mentor?	Relational	16	4.50	.730	1.15	.325
	Instrumental	18	4.61	.849		
	Risk Reduction	17	4.17	1.01		
	Total	51	4.43	.877		
How satisfied are you with the mentoring activities you participated in?	Relational	16	4.06	.997	2.54	.089
	Instrumental	18	4.16	.923		
	Risk Reduction	17	3.35	1.45		
	Total	51	3.86	1.18		
Overall, how satisfied are you with the mentoring program?	Relational	16	4.37	.718	1.49	.234
	Instrumental	18	4.16	1.15		
	Risk Reduction	17	3.76	1.14		
	Total	51	4.09	1.04		

Was there any significant change in outcomes (academic rating, satisfaction, connectedness) reported by mentees from beginning (at pretest) to end of the program (posttest) as a result of participating in mentoring? Paired t-tests conducted (see table below) revealed that mentees participating in mentoring with a relational and instrumental approach had the most number (5) of outcomes with significant change from pretest to posttest in comparison to mentees receiving risk reduction mentoring (4). Out of the 14 measures that were found to be significant, 12 were associated with connectedness. These results should be interpreted cautiously given the small sample with complete data available for analysis.

Outcomes by Intervention from Pretest to Posttest (Year 2)
[Only those measures with significant findings are reported]

Intervention	Measure	N	Pre-test		Post-test		t	df	p
			mean	SD	mean	SD			
Relational	Connectedness to self	16	22.84	5.37	25.43	4.03	3.221	15	.006
	Connectedness to parents	14	23.64	3.31	25.57	1.98	2.161	13	.050
	Connectedness to peers	15	22.93	2.98	21.26	4.21	-2.157	14	.049
	Teacher's perception of connectedness to peers	15	20.26	3.99	21.90	4.71	-2.413	14	.030
	Teacher's perception of connectedness to teachers	14	19.57	4.53	22.35	3.87	-3.150	13	.008
Instrumental	Connectedness to siblings	15	15.60	5.52	18.40	5.75	2.564	14	.022
	Connectedness to school	16	23.00	2.65	19.93	3.27	-3.717	15	.002
	Connectedness to teachers	17	23.70	2.64	20.83	4.34	-2.309	16	.035
	Connectedness to boyfriend/girlfriend	17	15.73	7.32	12.64	7.10	-2.462	16	.026
	Parent's perception of connectedness to school	12	23.58	4.60	20.75	3.79	-3.845	11	.003
Risk Reduction	#of delinquency type of behaviors engaged in	14	.8571	1.09	2.00	1.92	2.511	13	.026
	Connectedness to friends	14	18.42	5.78	21.00	6.10	2.548	13	.024
	Connectedness to peers	14	20.78	3.80	18.07	4.68	-2.233	13	.044
	Parent's stress related to care of child	8	2.18	.587	1.68	.498	-2.430	7	.045

Was there any significant change in wellbeing (reported behavioral problems, self-esteem, family functioning, or number of delinquency type of behaviors engaged in) reported by mentees from beginning (at pretest) to end of the program (posttest) as a result of participating in mentoring? The table below reports the results of paired t-tests conducted on completed responses from mentees across the three types of mentoring implemented in year 1. The results indicate that self-esteem as measured by the Rosenberg Self-Esteem Scale was found to be reported to be higher at the end of the program participation for mentees participating in relational mentoring. This higher score was statistically significant. There was a significant increase in the number of delinquency type of behaviors engaged in by mentees participating in risk reduction mentoring, rather than a decrease as was expected. These results should be interpreted cautiously given the small sample with complete data available for analysis.

Outcomes by Intervention from Pretest to Posttest (Year 2)
[Wellbeing Domains]

Intervention	Measure	N	Pre-test		Post-test		t	df	p
			mean	SD	mean	SD			
Relational	Child Behavior Rating Index (BRIC)	15	28.58	14.02	30.66	12.51	.881	14	.393
	Self-Esteem (Rosenberg self-esteem scale)	15	30.00	4.53	35.60	4.27	4.244	14	.001*

	#of delinquency type of behaviors engaged in	14	.857	1.09	2.00	1.92	2.511	13	.026*

Were there any significant differences between types of mentoring received and pre-post change in relationship satisfaction? Types of mentoring were compared on change scores for various domains of satisfaction. Change scores were computed (by subtracting pretest scores from post scores) and ANOVAs were performed. The results did not indicate any statistically significant difference in relationship satisfaction change scores. In other words, there was no statistically significant difference in change scores between types of mentoring received and satisfaction domains.

Relationship Satisfaction by Type of Mentoring (Year 2)

Change in	Type of Mentoring	N	Mean	SD	F	Sig.
life satisfaction	Relational	16	.875	2.60	.832	.441
	Instrumental	18	.000	1.87		
	Risk reduction	15	.133	1.68		
	Total	49	.326	2.08		
family life satisfaction	Relational	16	.937	2.59	1.560	.221
	Instrumental	18	-.333	1.60		
	Risk reduction	15	.400	2.06		
	Total	49	.306	2.13		
satisfaction with sibling relationships	Relational	15	1.20	2.42	.499	.610
	Instrumental	18	.444	1.72		
	Risk reduction	15	.733	2.37		
	Total	48	.770	2.14		
satisfaction with relationship with mother	Relational	16	.437	2.65	.155	.857
	Instrumental	18	.055	1.51		
	Risk reduction	15	.200	1.69		
	Total	49	.224	1.97		
Satisfaction with relationship with father	Relational	16	-.250	2.14	1.554	.222
	Instrumental	17	-1.00	2.44		
	Risk reduction	15	.466	2.44		
	Total	48	-.291	2.37		

Were there any significant differences between types of mentoring received and satisfaction change (post-pre change) related school? Types of mentoring were compared on change scores for various domains of satisfaction related to school. Change scores were computed (by subtracting pretest scores from post scores) and ANOVAs were performed. The results did not indicate any statistically significance difference in school related satisfaction change scores. In other words, there was no statistically significant difference in change scores between types of mentoring received and school satisfaction domains.

Satisfaction with relationship with teachers	Relational	16	.187	2.19	.579	.565
	Instrumental	18	-.055	1.16		
	Risk reduction	15	.600	1.80		
	Total	49	.224	1.73		
Satisfaction with school	Relational	16	.125	2.27	2.174	.125
	Instrumental	18	-1.11	2.47		
	Risk reduction	15	.533	2.38		
	Total	49	-.204	2.44		
Self- rating as student (excellent, good, fair, poor)	Relational	16	-.187	.403	2.542	.090
	Instrumental	18	.305	.859		
	Risk reduction	14	-.107	.684		
	Total	48	.020	.706		
Liking school	Relational	16	-.312	1.49	1.021	.369
	Instrumental	18	.055	1.43		
	Risk reduction	14	-.642	1.15		

Were there any significant differences between types of mentoring received and change (post-pre) in wellbeing? Types of mentoring were compared on change scores for various domains of wellbeing. Change scores were computed (by subtracting pretest scores from post scores) and ANOVAs were performed. Change in self-esteem score among mentees in the relational mentoring was statistically greater than change in self-esteem scores for mentees in the instrumental and risk reduction mentoring. Mentees in the instrumental and risk reduction mentoring did not statistically differ from each other in change in self-esteem scores.

A Comparison of Wellbeing Change (Year 2)

Measure	Type of Mentoring	N	Mean	SD	F	Sig.
Behavior Rating Index for Children(BRIC)	Relational	15	2.08	9.15	1.05	.358
	Instrumental	18	4.65	14.70		
	Risk Reduction	14	12.50	31.59		
	Total	47	6.17	20.14		
Family APGAR	Relational	14	1.21	2.11	2.36	.107
	Instrumental	16	-.750	2.46		
	Risk Reduction	14	-.571	3.34		
	Total	44	-.068	2.76		

Self-Esteem (Rosenberg Self-Esteem Scale)	Relational	15	5.60	5.11	8.28	.001*
	Instrumental	15	-2.26	6.01		
	Risk Reduction	14	-.500	5.45		
	Total	44	.977	6.41		
#of delinquency type of behaviors engaged in	Relational	14	-.642	3.15	2.11	.133
	Instrumental	18	.555	2.03		
	Risk Reduction	14	1.14	1.70		
	Total	46	.369	2.40		

Were there any significant differences between types of mentoring received and pre-to post mentoring change in connectedness? Types of mentoring were compared on change scores for various domains of connectedness as measured by the Hemingway Measure of Preadolescent Connectedness (Karcher, 2001; Karcher & Lee, 2002). Change scores were computed (by subtracting pretest scores from post scores) and ANOVAs were performed. Change in connectedness to self scores among mentees in the relational mentoring was statistically different (increase) than change in connectedness to self-scores (decrease) for mentees in the instrumental and risk reduction mentoring. Mentees in the instrumental mentoring did not statistically differ from risk reduction mentoring participants in regards to change in connectedness to self scores, although both instrumental and risk reduction had decreased change in connectedness to self scores.(see table below).

Change in Connectedness (Hemmingway) (Year 2)

Connectedness to (subscale):	Type of Mentoring	N	Mean	SD	F	Sig.

For youth who had participated in the three types of mentoring program, Is there any difference in their reported wellbeing at 6 month follow-up? Relational mentoring participants had statistically significant higher self-esteem scores than participants in instrumental mentoring but not those in risk reduction mentoring. There was no statistically significant difference in self-esteem scores between the risk reduction and instrumental mentoring groups. No group differences were found in other domains of wellbeing that were examined (see table below).

Wellbeing 6-month Follow-Up (Year 2)

Measure	Type of Mentoring	N	Mean	SD	F	Sig.
Behavior Rating Index for Children(BRIC)	Relational	10	20.50	15.75	2.275	.118
	Instrumental	15	32.16	13.75		
	Risk Reduction	12	34.06	18.65

	Risk Reduction	15	1.06	1.48		
	Total	41	1.12	2.09		

For youth who had participated in the three types of mentoring program, Is there any difference in their reported relationship satisfaction at 6 month follow-up? Relational mentoring participants had statistically significant higher scores specific to satisfaction with relationship with father than participants in instrumental mentoring but not those in risk reduction mentoring. There was no statistically significant difference in satisfaction with relationship with father between the risk reduction and instrumental mentoring groups. In regards to other satisfaction domains, there was no statistically significant difference among the three types of mentoring compared in the analysis.

Relationship Satisfaction at 6-Month Follow-Up (Year 2)

Change in	Type of Mentoring	N	Mean	SD	F	Sig.
life satisfaction	Relational	11	6.45	.687	1.224	.305
	Instrumental	15	5.66	1.63

Mentors

What is the profile of mentors that participated in mentoring during the 2nd year of the program? The table below lists the characteristics of 2nd year mentors across the three schools. On the whole, they were majority female, African American or other, tended to be the oldest child in their family, and between the ages of 16 and 18. Most of the mentees reported as being good students with average GPA above 3.0. Few of them liked coming to school “a lot”. Majority participated in one or more school activities. Between 0 to 10% reported that they skipped school. However, between 16% to 20% reported they had been suspended from school.

Mentor Demographics(Year 2)

Overall, how did mentors evaluate the training they received to become a mentor and the mentoring they provided?(Year 2). Ratings ranged from 3.6 to 4.96 (range 1 to 5 with 5 being the highest rating) Overall, there was only one significant difference between the mentors across the three types of mentoring they were providing. They differed in their satisfaction with the mentoring program, with mentors in the instrumental mentoring group with overall average lower satisfaction ratings than either relational or risk reduction mentoring.

Comparison of Mentor's Evaluation of Mentor Training and Training Satisfaction Across Mentoring Interventions (Year 2)

		N	Mean	Std. Deviation	F	Sig.
How helpful was the following? The use of role playing or practice exercises as a part of the program?	Relational	25	3.840	.8981	1.588	.211

Parents

In year 2, How satisfied were parents with mentoring received by their child? The table below shows average satisfaction scores by type of mentoring provided. Parents of youth participating in instrumental mentoring were significantly less satisfied with mentoring their child had received than parents of youth participating in relational mentoring. No statistically significant differences were found between parents of instrumental and risk reduction participants or between parents of relational and risk reduction participants in regards to mentoring received by their child. A similar pattern in findings was found in regards to parents' satisfaction with youth's relationship with his or her mentor.

Parental Satisfaction with Mentoring (Year 2)

Aspects of mentoring	Type of mentoring	n	mean	Standard deviation	F	Sig.
How satisfied are you with the mentoring your child has received?	Relational	13	4.69	.48	3.791	.034*
	Instrumental	13	3.69	1.10		
	Risk reduction	8	4.37	1.18		
	Total	34	4.23	1.01		
How satisfied are you with your child's relationship with his or her mentor?	Relational	13	4.92	.27	4.648	.017*
	Instrumental	13	3.92	1.115		
	Risk reduction	8	4.37	.91		
	Total	34	4.41	.92		
How satisfied are you with the mentoring activities your child participated in?	Relational	13	4.61	.65	1.532	.232
	Instrumental	13	3.92	1.11

	Risk reduction	8	4.25	1.16		
	Total	34	4.41	.92		

Summary

The overall goal of this project was to evaluate whether cross-age mentoring is an effective model for use with middle school children at varying degrees of risk for juvenile delinquency. Middle school youth (6th graders) with at least one other risk factor for juvenile delinquency were recruited to receive mentoring from high school juniors and seniors trained as mentors. Mentees received one of three conditions: relational, instrumental or risk reduction. A quasi-experimental research design with data collection at baseline, program completion, and at 3 months post program completion was implemented. Data was collected on a set of indicators prior to program start-up, program completion, and three-months post program completion.

In year 1 of this research, mentees tended to be male, minority, and between the ages of 11 and 13. They described themselves as good students despite only a few admitting liking school “a lot”. Few reported skipping school but a moderate percentage had been suspended from school. Overall, mentees gave high satisfaction ratings to the mentoring they received.

There was no clear pattern observed between mentoring type and outcomes tracked in this research. However, for Year 1, some interesting non findings include: no statistically significant difference between types of mentoring received and change in satisfaction domains, no statistically significant difference in change scores between types of mentoring received and satisfaction with various aspects related to school, and no statistically significant relationship was detected between types of mentoring received and change in wellbeing.

On the other hand, in Year 1, in regards to connectedness, connectedness to mother (change scores) among mentees in the relational mentoring was statistically different (decrease) than change in connectedness to mother (change scores --increase) for mentees in risk reduction mentoring. Relational mentoring participants had statistically significant higher family APGAR (wellbeing/functioning) scores than participants in risk reduction mentoring but not those in instrumental mentoring. Relational mentoring participants had statistically significant higher family life satisfaction and relationship satisfaction with mother scores than participants in instrumental mentoring but not those in risk reduction mentoring. At 6-month follow-up, there was no statistically significant difference in satisfaction related to various aspects of school and types of mentoring received.

In Year 1, mentors, on the whole, were mostly female, minority, tended to be the oldest child in their family, and between the ages of 16 and 18. Most of them reported as being good students with average GPA above 3.0. Few of them liked coming to school “a lot”. Majority participated in one or more school activities. A small percentage reported they had skipped school. However, between 9% to 27% they had been suspended from school. Overall, results indicate that mentors assigned to instrumental mentoring reported being less prepared to provide mentoring. After completing the mentoring program, mentors assigned to instrumental mentoring were less likely to be satisfied with the mentoring they provided, the mentoring activities they participated in, and their overall satisfaction with the mentoring program.

In Year 2 of this research, mentees were mostly male, African American, tended to be the middle child, and between the ages of 11 and 13. Most of them reported as being good students with “A” grades. Few of them liked coming to school “a lot”, participated in two or more school activities, or reported skipped school. Between 4% to 36% reported they had been suspended from school. When compared to each other, mentees across the three types of mentoring did not significantly differ on any aspect of mentoring satisfaction.

In regards to outcomes, paired t-tests conducted revealed that out of the 14 measures that were found to be significant, 12 were associated with connectedness. However, results

indicated that there was no statistically significant difference in change scores between types of mentoring received and relationship satisfaction domains. Also, findings indicate there was no statistically significant difference in change scores between types of mentoring received and school satisfaction.

In Year 2, mentors were mostly female, African American or other, tended to be the oldest child in their family, and between the ages of 16 and 18. Most of them reported as being good students with average GPA above 3.0. Few of them liked coming to school “a lot”. Majority participated in one or more school activities. Between 0 to 10% reported that they skipped school. However, between 16% to 20% reported they had been suspended from school. Overall, there was only one significant difference between the mentors across the three types of mentoring they were providing. They differed in their satisfaction with the mentoring program, with mentors in the instrumental mentoring group with overall average lower satisfaction ratings than either relational or risk reduction mentoring.

Parents of youth participating in instrumental mentoring were significantly less satisfied with mentoring their child had received than parents of youth participating in relational mentoring. A similar pattern in findings was found in regards to parents’ satisfaction with youth’s relationship with his or her mentor.

Finally, these results need to be viewed cautiously because the sample sizes for many of the analyses were small, and the quasi nature of the research design also may have influenced the results, possibly skewing the findings. There was also the issue of missing items and misunderstanding by mentees of the survey items. A number of instruments and data from them were not useable due to this misunderstanding that may have occurred on the part of mentees when they completed the survey. In future research, youth’s verbal, written, and reading levels should be strongly assessed and reviewed in constructing and choosing instruments as well as the method of instruction.
